Subject: PPL P06-V-9--Emergency Response Plan, Post-Accident Breathable Air

Would it be possible to use something like the old systems airdox/cardox (compressed air) and run the compressed air thru the intake entries ? These systems were fairly reliable even 40 yrs ago and not too expensive then. Portable tanks could be stored and recharged, put against the ribs, they should stand quite a bit of force. Just a thought. Re-filled as one traveled out of the mine or refilled as you waited for rescue. Best I recall the old systems operated at about 1000 psi. Thanks , Greg Hall.
