On Monday, August 6, 2007, at approximately 2:52 a.m. MDT, a major coal outburst/bounce occurred on the Main West pillar section (MMU 002-0), which trapped six miners on the section. At the time, the section crew was in the process of retreat mining the south barrier area of the section and was reported to have been mining near crosscut 139. The other six miners in the mine responded to the Main West section but were unable to proceed past crosscut 124 due to material blocking the entries. Rescue efforts commenced and mine rescue teams were sent underground for further exploration. They were only able to advance to crosscut 126. On August 16, 2007, ten days into the underground rescue effort, an outburst/bounce occurred near crosscut 126 in the No. 1 entry at approximately 6:32 p.m. Three rescue workers were fatally injured and rescue efforts to approach the trapped miners from underground were suspended. Surface rescue work consisting of drilling boreholes into the affected area to search for the trapped miners continued. Seven boreholes from 1,414 feet to 2,033 feet deep were drilled. Holes in the affected area found an oxygen level of 7.5% and coal and debris filling the entries near where the miners were thought to be mining. All rescue work was suspended on August 31, 2007.

The information provided in this notice is based on preliminary data ONLY and does not represent final determinations regarding the nature of the incident or conclusions regarding the cause of the accident.
