## P R O C E E D I N G S

1  
2 -----  
3 ATTORNEY WILSON:

4 Good afternoon. My name is Bob Wilson.

5 I am with the Office of the Solicitor, United States  
6 Department of Labor. We're here with Joe Mackowiak.  
7 Today is May 17, 2010. With me is Richard Stoltz, an  
8 accident investigator with the Mine Safety and Health  
9 Administration. Also present are several persons with  
10 the State of West Virginia. I ask that they state  
11 their appearance for the record.

12 MR. BECK:

13 I'm Jim Beck. I work for Davitt McAteer  
14 on the independent team.

15 MR. FARLEY:

16 Terry Farley, with the West Virginia  
17 Office of Miners' Health, Safety and Training.

18 MR. O'BRIEN:

19 John O'Brien, with the Office of Miners'  
20 Health, Safety and Training.

21 ATTORNEY WILSON:

22 There are several members of the  
23 investigation teams also present in the room today.  
24 All members of the Mine Safety and Health  
25 Administration Accident Investigation Team and all

1 members of the State of West Virginia Accident  
2 Investigation Team participating in the investigation  
3 of the Upper Big Branch Mine explosion shall keep  
4 confidential all information that is gathered from  
5 each witness who voluntarily provides a statement  
6 until witness statements are officially released.  
7 MSHA and the State of West Virginia shall keep this  
8 information confidential so that other ongoing  
9 enforcement activities are not prejudiced or  
10 jeopardized by a premature release of information.  
11 This confidentiality requirement shall not preclude  
12 investigation team members from sharing information  
13 with each other or with other law enforcement  
14 officials. Everyone's participation in this interview  
15 constitutes their agreement to keep this information  
16 confidential.

17 Joe, government investigators and  
18 specialists have been assigned to investigate the  
19 conditions, events and circumstances surrounding the  
20 fatalities that occurred at the Upper Big Branch Mine-  
21 South on April 5th, 2010. The investigation is being  
22 conducted by MSHA, pursuant to Section 103(a) of the  
23 Federal Mine Safety and Health Act and by the West  
24 Virginia Office of Miners' Health, Safety and  
25 Training. We appreciate your assistance in this

1 investigation.

2 After the investigation is complete, MSHA  
3 will issue a public report detailing the nature and  
4 causes of the fatalities in the hope that greater  
5 awareness about the causes of fatalities can reduce  
6 their occurrence in the future. Information obtained  
7 through witness interviews is frequently included in  
8 these reports. You should know that if you request  
9 confidentiality, confidentiality will only be granted  
10 on a case-by-case basis. Your statement may also be  
11 used in other enforcement proceedings.

12 You may have a personal representative  
13 present during the taking of this statement and you  
14 may consult with that representative. Do you have a  
15 representative with you?

16 MR. MACKOWIAK:

17 No, I do not.

18 ATTORNEY WILSON:

19 You may refuse to answer any question and  
20 you may request a break at any time. This is not an  
21 adversarial proceeding. Formal Cross Examination will  
22 not be permitted, however, clarifying questions will  
23 be permitted as appropriate. The court reporter will  
24 record your interview. Please speak loudly and  
25 clearly. If you do not understand a question, please

1 ask that the question be rephrased. Please answer  
2 each question as fully as you can, including any  
3 information that you may have learned from someone  
4 else.

5 Again, I would like to thank you in  
6 advance for appearing here. We appreciate your  
7 assistance in this investigation. Your cooperation is  
8 critical in making the nation's mines safer. After we  
9 have finished asking questions, you will be provided  
10 an opportunity to clarify any of your previous answers  
11 and to provide any type of a statement if you choose  
12 to make one. After the interview, if you recall any  
13 additional information that you believe might be  
14 useful, please contact Norman Page at the contact  
15 information in the letter that I'm providing you now.  
16 At this time I'll ask the court reporter to swear you  
17 in.

18 -----  
19 JOSEPH MACKOWIAK, HAVING FIRST BEEN DULY SWORN,  
20 TESTIFIED AS FOLLOWS:

21 -----  
22 ATTORNEY WILSON:

23 Richard Stoltz will start out with the  
24 questioning.

25 EXAMINATION

1 BY MR. STOLTZ:

2 Q. Joe, would you please state your full name and  
3 spell your last name, please?

4 A. Joseph Charles Mackowiak, M-A-C-K-O-W-I-A-K.

5 Q. Would you please state your address and telephone  
6 number?

7 A. I reside at (b) (7)(C) ,  
8 (b) (7)(C) . And I'm sorry, what was the  
9 second part of the question?

10 Q. Telephone number, please?

11 A. (b) (7)(C) .

12 Q. Are you appearing here today voluntarily?

13 A. Yes, I am.

14 Q. How long have you worked for MSHA?

15 A. Nine-and-a-half years.

16 Q. What is your current duty station?

17 A. Mount Hope, West Virginia, District 4.

18 Q. How long have you worked at that location?

19 A. Since 2004.

20 Q. What is your present position?

21 A. Ventilation supervisor, however, my title is  
22 supervisory mining engineer.

23 Q. How long have you been in that position?

24 A. Since June of 2008.

25 Q. How many people do you supervise?

1 A. Six plan reviewers and one secretary, seven.

2 Q. Who is your current supervisor?

3 A. Richard Kline.

4 Q. Could you please tell us some of your mining  
5 history and experience?

6 A. Sure. I started working for A.T. Massey Coal  
7 Company in the summer of my sophomore year of college,  
8 and worked for them until --- that began in 1992, and  
9 worked for that company through college. Upon  
10 completion of college, I worked for them through  
11 January 2000, approximately seven years.

12 Q. What did you do while at Massey?

13 A. I did mining engineering, surveying, AutoCAD while  
14 in school. Upon graduation, I worked underground at  
15 various underground coal mines along the Route 3 area.  
16 For a period of time I did various construction  
17 projects, and additionally, some mining engineering in  
18 the Route 3 area, and then again in the Summersville  
19 area.

20 Q. Basically a lot of your experience was engineering  
21 experience?

22 A. Well, about two-and-a-half years of underground  
23 experience followed by mining engineering.

24 Q. Do you have any specialized training or  
25 certificates?

1 A. Yeah. I'm a Certified Impoundment Inspector with  
2 the Mine Safety and Health Administration. I'm a  
3 certified dust --- certified with dust pumps with the  
4 Mine Safety and Health Administration. I am both a  
5 surface and underground instructor with the State of  
6 West Virginia, as well as with the United States  
7 Department of Labor, Mine Safety and Health  
8 Administration. I have a Bachelor's of Science degree  
9 in Mining Engineering from West Virginia University.  
10 I am a Registered Professional Engineer in the State  
11 of West Virginia. I am a Certified Underground Mine  
12 Foreman --- Assistant Mine Foreman. I'm also a  
13 Certified Underground Miner. I have a Master's of  
14 Science in Safety from Marshall University. I think  
15 that's it.

16 Q. Okay. In your current position, what is your  
17 primary areas of responsibilities?

18 A. Primarily to process ventilation plans for  
19 District 4 and to supervise plan reviewers in the  
20 processing of ventilation plans and to work  
21 collaboratively with the district field offices for  
22 issues that may be raised during inspections related  
23 to ventilation.

24 Q. Is ventilation plans your only area of  
25 responsibility?

1 A. Well, we occasionally assist on EO1 regular  
2 inspections, quarterly inspections. My guys --- I'll  
3 go out occasionally as well. I occasionally help with  
4 the editing of fatal accident reports for the  
5 district. I've also served on various committees,  
6 including SCSR, Bleeder and Gob Committee. And that's  
7 essentially it for right now. Now, in the past I've  
8 done several other things. I don't know how broad of  
9 a question you want answered.

10 Q. That's good. How many active underground coal  
11 mines are currently in the district?

12 A. I don't keep a day-to-day count of it. The last I  
13 heard from the district manager, Robert Hardman, was  
14 245.

15 Q. And you would be responsible for all the vent  
16 plans for ---

17 A. Yes, sir.

18 Q. --- all those?

19 A. Yes.

20 Q. Could you go over the standard operating  
21 procedures for reviewing a submitted ventilation plan?

22 A. Sure. When a ventilation plan comes into the  
23 district, it is date stamped upon receipt to show  
24 what --- you know, when it arrived. It goes through  
25 clerical person's hands in being input into our MIS,

1 mine tracking. It's a plan tracking software. And  
2 then it essentially gets put into a series of bins  
3 that are holding bins spread --- based on the type of  
4 plan that they are. I will assign that plan to a plan  
5 reviewer and they will conduct a review of the plan.  
6 Upon their completion, they attach an approval or  
7 denial letter to it, and they submit it to me for  
8 secondary review. I conduct that review. If ---  
9 depending on what --- whether we agree or not depends  
10 on whether it goes to Mr. Kline for a third-level  
11 review. And if I agree with the conclusions of the  
12 plan reviewer, whether it be approved or denied, then  
13 I will sign it and pass it on.

14 Now, one of the steps that occurs prior to it  
15 coming to me is that plan is reviewed with the field  
16 office, preferably the supervisor or the inspector  
17 assigned to the mine, to ensure that it's applicable  
18 to the mining conditions and that it will function as  
19 desired. Frequently we require their input on  
20 everything from mining near gas wells to ventilation  
21 map revisions, where a mine operator wants to turn an  
22 air course, or to plan revisions themselves, like a  
23 face sketch wants to be changed or something similar  
24 to that. But we always take everything through the  
25 field office, either verbally, by explaining item by

1 item what's in the plan, or you know, we like to also  
2 send 'em --- scan 'em and send 'em to the field  
3 office.

4 Now, once I agree or disagree with their  
5 conclusion, it goes to Richard Kline, who does an  
6 additional review. He's the Assistant District  
7 Manager of Technical Programs. And upon his review,  
8 he forwards it to the Assistant District Manager of  
9 the Enforcement Division, who actually manages all the  
10 field offices for them to review it and either concur  
11 or disagree, at which time --- at any time they  
12 disagree it comes back to me. And then we'll contact  
13 the mine operator and work on whatever plan details  
14 are necessary to make that plan acceptable.

15 And then finally, from the Assistant District  
16 Manager, Enforcement Programs, it ends up at the  
17 District Manager's desk. Now, we are all making  
18 recommendations, from my plan reviewer through the  
19 Assistant District Manager of Enforcement, making  
20 recommendations, but the final determination is made  
21 by the District Manager, as to whether to approve or  
22 deny a plan.

23 Let me add just one more. The final process is it  
24 comes back to the district, to my office, for  
25 transmittal to the mine operator and to the field

1 office, and at which time a copy is sent --- two  
2 copies are sent to the field office, one for the  
3 residing inspector, whoever is there at the time, one  
4 for their records in the uniform mine file. The  
5 additional copy goes into our records in the  
6 Ventilation Department for the purpose of reviews. We  
7 re-review all of those upon each annual map to assure  
8 that they're still applicable.

9 Q. Who normally submitted plans for the Upper Big  
10 Branch Mine?

11 A. Several people submitted plans for the Upper Big  
12 Branch Mine. Normally, it would be Eric Lilly, an  
13 engineer that worked for Performance or Route 3  
14 Engineering. I believe he told me verbally he worked  
15 for Route 3 Engineering. However, when he submitted  
16 plans, he did it on Performance Coal Company  
17 letterhead. And occasionally plans were submitted  
18 within six months prior to the accident also by Bill  
19 Ross, Chris Adkins and Chris Blanchard.

20 Q. Did you have any meetings with upper mine  
21 management personnel concerning submitted or proposed  
22 plans? Please give me the name and titles.

23 A. Prior to approval or after approval?

24 Q. Prior or after.

25 A. There were several meetings.

1 Q. And the purpose of the meetings?

2 A. Okay. There were several meetings. It's a broad  
3 question, so it's difficult. But let me start --- one  
4 that stands out is the mine received approval to  
5 reverse belt air on December 18th. After  
6 implementation in the days following that, Bill Ross  
7 and Chris Adkins, who I believe is vice-president of  
8 Massey Energy, came to my office the morning of  
9 December 23rd requesting a plan to change the December  
10 18th plan due to difficulties encountered during  
11 implementing. They hand delivered a plan with them.  
12 We looked at it. We being --- and I'm not absolutely  
13 sure on the meeting attendees, but I'm sure I had a  
14 plan reviewer there, which one I'm not sure of, Rich  
15 Kline and possibly Luther Marrs. But I'm not really  
16 exactly sure. There's some notes on that.

17 Well, I don't think I took notes that day,  
18 actually. But they described that due to the  
19 influence of the bleeder fan on those neutral air  
20 courses in the Number One entry of the headgate, that  
21 they were unable to turn the belt air from  
22 approximately the panel two crossover, which is mining  
23 from headgate --- the active headgate towards Headgate  
24 22, inby to the area here shown December 2009, which  
25 is approximately crosscut 49 or 50, in that general

1 area. And subsequently, their plan stated that the  
2 neutral air course would split and a portion of it  
3 from the crossover, at about crosscut 28 would go inby  
4 and 28 would go outby to a regulator located at  
5 approximately crosscut 12, in that general area. But  
6 the specifics of that plan are on the December 23rd  
7 plan. And basically they described the influence of  
8 the bleeder fan was too great for them to turn the  
9 entire thing.

10 A portion of that plan also described upon their  
11 submittal, in their submittal letter, that the ---  
12 they would have a long-term plan to change the belt  
13 air around. Now, I had several meetings prior to that  
14 during previous plan reviews. I don't know the exact  
15 dates of 'em, in which we had requested ---.

16 Q. Would it be helpful for that plan to go --- I  
17 guess lay out each plan and go over each of the  
18 approved plans and then talk about denials? Would  
19 that be ---?

20 A. If we can do that in chronological order from  
21 all --- that would be very helpful.

22 Q. And it sounds like what you're saying is a lot of  
23 your meetings pertained to either approvals or denials  
24 of plans ---

25 A. Yes.

1 Q. --- and the various accompanying officials?

2 A. Yes, one of which, which really didn't have to do  
3 with approvals and denials, in mid-January Wayne  
4 Persinger, I believe, was transferred to the mine and  
5 he came to our office without any company engineers  
6 and met with Link Selfe, I believe Rich Kline, Jim  
7 Humphrey from the district, who was acting as a field  
8 office supervisor at the time, and just to basically  
9 get to know one another. He described what he was  
10 doing at the mine, why he was there, due to compliance  
11 challenges. And we basically gave him our current  
12 status of the mine with regard to past citations and  
13 orders issued. There was also a meeting for that. It  
14 really didn't have much to do with plans, per se, but  
15 it did have to do with mine conditions.

16 Q. I guess how do you know when a plan has been  
17 implemented?

18 A. That's very difficult. The only way to know that  
19 a plan has been implemented is to talk to our MSHA  
20 employees who have been into the mine. There is no  
21 reporting requirements by the operator.

22 Q. Moving on, I was going to talk a little bit about  
23 the Belt Air Rule. And the Belt Air Rule was  
24 effective on December 31st, 2008. Underground coal  
25 mines were required to have a plan to the district by

1 March 1st. Could you please explain or discuss the  
2 effect of the regulation on the mines in your  
3 district?

4 A. By and large, the mines in my district were not  
5 prepared for the Belt Air Rule. They didn't fully  
6 understand the requirements of it. Several meetings  
7 with some of the mine operators, they were fairly  
8 resilient to change. And it took multiple requests on  
9 the part of the district to basically get them to turn  
10 in their belt air requests, either a justification for  
11 the belt air they were currently using or the request  
12 to use it or the request to change it. Under 370, the  
13 mine ventilation plan has to be developed and  
14 submitted by the mine operator. It requires them to  
15 have a fundamental understanding. So we gave out  
16 copies of the Final Rule and discussed it with them.  
17 I kept a notice on the whiteboard in the district  
18 within my office so all mine operators could see that  
19 there was a requirement. And despite that, we still  
20 had to send out multiple letters in order to prompt  
21 that. Now, it being a new regulation, we weren't  
22 extremely punitive in its application initially. We  
23 wanted to more or less educate the mine operators and  
24 get that --- get that ball rolling, so to speak.  
25 Some mine operators turned right around and gave a

1 justification that was subsequently approved. It  
2 generally took several submittals to get an approval  
3 because the mine operators weren't familiar with the  
4 new regulations, and there wasn't a whole lot of  
5 guidance within the regulation itself with regard to  
6 like a checklist. There wasn't a checklist in the  
7 regulation with regard to what would be necessary for  
8 that plan.

9 This mine, in particular, with regard to belt air,  
10 was very difficult to deal with in that it took  
11 multiple notifications. They had a base plan --- they  
12 got approval for use of the longwall, I believe it was  
13 August 6th, 2009. On that approval for the longwall  
14 contained a face sketch which showed belt air being  
15 used. Now, due to the influence of the bleeder fan,  
16 that was fairly normal. The bleeder fan would want to  
17 pull the neutral air courses that way. At that time,  
18 it was requested from them verbally from me that they  
19 address the belt air issue. Again, we were fairly  
20 lenient with the application of the new regulation  
21 because it was new. We asked for it then.

22 We addressed it again approximately November 20th  
23 in a plan correspondence for this issue to be  
24 addressed, either justification for its use or its  
25 elimination, as required by the regulation. We

1 requested again December 3rd, via plan correspondence,  
2 December 4th via plan correspondence, I believe again  
3 on December due to plan correspondence.

4 I'm trying to hold to those dates. Again, I'm  
5 going off memory. But I believe within either the  
6 approvals or denials, it was in a plan letter. We did  
7 that several times.

8 Just prior to December 9th, the company engineer,  
9 Eric Lilly, stated to me that he did not have a copy  
10 of the regulations. So you'll see within that letter  
11 that requested --- it states in there that a copy of  
12 the regulations did accompany that. Now, he picked  
13 that up in my office from my secretary and attached it  
14 accordingly on that day, on that morning. And that  
15 essentially, I guess, got the point across that they  
16 either needed a justification or removal pursuant to  
17 the regulations. And they submitted and was approved  
18 to get off of belt air on December 18th. However,  
19 again, as I previously stated, they had difficulty  
20 implementing that revision, and they revised that  
21 revision on December 23rd. And that was the meeting  
22 with Bill Ross and Chris Adkins.

23 Q. I'm now going to, I guess, move on to the ---  
24 basically try to walk you through the approved  
25 ventilation plans.

1 MR. STOLTZ:

2 But before I do that, Terry or Jim, did

3 you have anything --- follow-up questions, I guess, on

4 what was initially covered?

5 MR. FARLEY:

6 Very quickly.

7 EXAMINATION

8 BY MR. FARLEY:

9 Q. Mid-January Wayne Persinger met with Link Selfe,  
10 Rich Kline, Jim Humphrey, et cetera. What was  
11 Persinger's job? What was his position?

12 A. I don't know his exact title. He was transferred  
13 to the mine in order to address their compliance  
14 issues. They received numerous orders from the Mine  
15 Safety and Health Administration. And in particular,  
16 he talked about some things that he had observed and  
17 seen with regard to doors or access via scoop down  
18 here in the southern part of the mine. It's off the  
19 map that's on the table, but it's --- and I don't know  
20 the exact area because he briefed us very quickly, but  
21 somewhere down there an acting, producing section that  
22 was driven off from near the South Portal. He talked  
23 about that and just trying --- explained that he was  
24 trying to get to know the mine and was walking the  
25 areas and traveling with people, trying to get an idea

1 as to, you know, how to help --- how to help the area,  
2 how to help the mine.

3 Q. Okay. Earlier on you indicated that UBB plans  
4 were normally submitted by Eric Lilly, also Bill Ross,  
5 Chris Adkins, and you mentioned Chris Blanchard.

6 A. Yes.

7 Q. Anything in particular that came from him?

8 A. That was not the norm that it was received from  
9 Chris Blanchard. However, he did submit one or two.  
10 Now, I can't quote to you which ones they are, but  
11 they tended to have his signature on their submittal  
12 letter.

13 Q. Okay. Was there anything different about his  
14 submittals as opposed to others? Was it ---?

15 A. Generally if he submitted a plan, he wanted a  
16 quick turnaround as much as possible. And when he  
17 turned it in, he wanted to meet with one of my group,  
18 either a plan reviewer or myself. And that's  
19 frequently done by mine operators throughout the  
20 district, that they want you to sit down and look at  
21 their plan upon submittals to tell them if there's any  
22 issues with it and get a pre-review, so to speak. And  
23 the reason being is we're a large district. We have  
24 volumes of submittals. And that's one way that the  
25 mine operators tend to, it appears to me anyway, try

1 to circumvent the waiting period in order to get a  
2 quick response, to kind of compensate for lack of  
3 proper planning or an extreme situation that --- like  
4 say a section hits rock ---. And it didn't happen in  
5 this mine, but I'm going to give you an example, where  
6 they hit rock and they have to move and they need a  
7 quick turnaround or they're going to suffer a loss in  
8 production. That's one way that they try to get their  
9 plan above the rest of 'em. You know, currently ---  
10 last week I had 136 or 139 outstanding plans. So you  
11 can see where that would be advantageous to the  
12 operator.

13 Q. Okay. Let's see here. You indicated in 2009,  
14 after the Belt Air Rule became effective December 31,  
15 2008, that UBB required multiple notifications?

16 A. Yes.

17 Q. Can you quantify multiple?

18 A. November --- August 6th, verbal, November 20th,  
19 December 3rd, December 4th, and again on December 9th,  
20 that's five notifications with no response.

21 Q. Okay.

22 MR. STOLTZ:

23 Jim?

24 EXAMINATION

25 BY MR. BECK:

1 Q. Mr. Mackowiak, you said there were 245 coal mines  
2 in District 4?

3 A. Roughly.

4 Q. Roughly. Is that all underground mines?

5 A. Those are underground coal mines. I think the  
6 total number of mines in the district is in excess of  
7 400 or hovers around that area.

8 Q. Would District 4 be the largest MSHA district in  
9 West Virginia?

10 A. It would certainly be in West Virginia.  
11 Geographically, it's --- I don't know if it's any  
12 larger. But as far as the volume of mines, yes.

13 Q. You mentioned Bill Ross. Did he formerly work  
14 with MSHA?

15 A. He did. He's an MSHA retiree.

16 Q. Where was his duty station when he retired, do you  
17 recall?

18 A. He was a ventilation supervisor for District 4.  
19 He had my current position prior to me.

20 Q. Do you know his job with Massey right now?

21 A. As I understand it, he works for Massey Coal  
22 Services, which is a technical management group. I've  
23 never really had it explained to me, but that's  
24 essentially what they do.

25 Q. Okay. And when Wayne Persinger came to visit you,

1 did he express any concerns about ventilation? Was  
2 that one of his issues?

3 A. Nothing in particular stands out, other than he  
4 said he was traveling the mine --- excuse me,  
5 traveling the mine in order to gain familiarity.

6 MR. BECK:

7 That's all.

8 RE-EXAMINATION

9 BY MR. STOLTZ:

10 Q. Okay. Joe, I'm going to, as I said, walk you  
11 through some of the various plans, starting from the  
12 August 6th, 2009 plan. And I guess I'd ask you to  
13 just go over and provide us some of the details on  
14 each of the plans as we go through 'em. The August  
15 6th, 2009 plan was the One North longwall startup plan  
16 submitted in July, which it was revised --- I know it  
17 says in the approval note three times prior to being  
18 approved. Could you just kind of walk us through what  
19 basically the plan entailed?

20 A. Yes, I will. The plan is comprised with ---  
21 initially on the cover it's initialed by me, J.M.,  
22 8/6. That's the date that I saw it from the reviewer.  
23 And it's just basically an initial in the lower  
24 right-hand corner stating that I was in agreement with  
25 the writing of the letter and the wording used within

1       it. The mine operator doesn't receive a copy of that.  
2       What he sees is page two in this packet, which doesn't  
3       have my initials in the lower right-hand corner. It  
4       only has a signature by Robert Hardman. Then there is  
5       a cover letter submitted by the company that's  
6       required on all plans, dated July 28, 2009. However,  
7       those dates are important that the operator puts into  
8       it because they don't always correspond with the date  
9       on which we received it. This one, in particular, in  
10      the lower right-hand corner, was logged in received on  
11      August 6th, 2009. So the total lapse time that we  
12      would have had, it would be from August 6th to August  
13      6th. So you can see that this was a same-day process.  
14      The letter initiates --- consists of three phases.

15      Phase one is a ventilation scheme during development  
16      of the north district coal reserves ---.

17      COURT REPORTER:

18      Wait a minute.

19      MR. STOLTZ:

20      Yeah, slow down.

21      COURT REPORTER:

22      You need to slow down.

23      A. I'm sorry.

24      COURT REPORTER:

25      Thanks.

1 A. The revision consists of three phases. Phase one  
2 is the ventilation scheme during development, prior to  
3 the exhausting fan being placed into service. The  
4 panel one crossover will be mined under the approved  
5 ventilation revision. Once the exhausting fan is  
6 placed in service, the vent scheme for mining  
7 crossover will reflect what is shown in the attached  
8 phase one map.

9 Phase two is a ventilation scheme for further  
10 development of the northern district and startup and  
11 activation of the longwall panel, establishment of  
12 bleeder evaluation checkpoints, the surface EP at the  
13 top of the bleeder return shaft, and the necessary  
14 ventilation controls being installed, removed. Also  
15 shown in phase two, as the sequence of mining panel  
16 two and three crossovers as well as sequencing for  
17 mining Headgate Two and Three.

18 It goes on for phase three. Shows the ventilation  
19 scheme for mining Headgate Two and Headgate Three once  
20 the panel two and three crossovers are completed. At  
21 this time the panel three crossover will be ventilated  
22 by return air in the Number Four entry and neutral in  
23 the One, Two and Three entries. The air from all four  
24 entries will enter the right return in the section  
25 mining Headgate Number Two. A description of the

1 bleeder system, including a line diagram, I had  
2 actually requested this to assure that the mine  
3 operator understood the requirements of 75.364, where  
4 air --- specifically (a)(2)(iii), where air exits the  
5 worked-out area and enters the bleeder air course. So  
6 that they knew prior --- or during development that  
7 they would have to travel the back of these longwall  
8 panels, the bleeder system, to the vent shaft,  
9 including the outlets from the worked-out area, for  
10 the entire ventilating district. And the reason  
11 that's of pertinent importance is if you go back to  
12 the 2005 face plan for this base plan for this mine,  
13 they were not required to travel the bleeder air  
14 courses in their entirety. Subsequently, they did not  
15 capture quantity, quality and direction for the air  
16 that exits the worked-out area. That's why the line  
17 diagram is in there, to assure that that portion of  
18 the regulations could be followed long term.

19 It includes general safety precautions for water  
20 control, roof control, the bleeder system evaluations,  
21 dictates what they're to do. And the page numbers  
22 aren't marked, but there is a map that is sideways  
23 that shows a plan view of the longwall and it includes  
24 MPA, MPB, EP Longwall One and EP Longwall Two. And  
25 those are the required items for 75.364(a)(2)(i),

1       where air enters the worked-out area.  
2       Additionally, it has a bleeder outlet point at the  
3       rear of the longwall, two regulators denoted on EP  
4       LW3, EP LW1 picked up, set of temporary check curtains  
5       in the headgate to direct air across the longwall  
6       face, a set of temporary regulators in the Number One  
7       and Number Two entries in the back of the longwall  
8       connector to assure that air, as they started the  
9       longwall, would go across the longwall face, and an  
10      additional outlet EP, just called EP TG1, which is  
11      everywhere where air exits the worked-out area on the  
12      tailgate side. It also shows in the plan view that  
13      there is a --- in the Number One entry of the  
14      tailgate, a return air course that is isolated from a  
15      bleeder system or from the worked-out area, heading  
16      back towards the return shaft at Bandy creek --- not  
17      Bandy creek but Bandytown. It shows an additional face  
18      sketch with a four-entry headgate, and that was for  
19      subsequent panels as they were laying out. It didn't  
20      apply for the first panel.

21      BY MR. STOLTZ:

22      Q. But that would be for a future panel?

23      A. That's for future panels. As you see on the  
24      left-hand side, it shows gob, which would be for the  
25      previously-mined longwall panel. It has an additional

1 one for --- this is for the second longwall panel.  
2 And again, the page is not marked, but it has Three  
3 --- Three entry tailgate, because it was mined on the  
4 first panel at Three entry headgate, followed by Four  
5 entry headgate. And then as the longwall went to the  
6 third panel in the district, it would have a four-  
7 panel tailgate with a four-panel headgate. And  
8 because --- it was required to be defined on each  
9 separate one because all the entry numbers varied from  
10 panel to panel. I wanted to make sure that they had  
11 addressed that properly.

12 Q. So that would be a typical face sketch for ---?

13 A. For longwall mining?

14 Q. Yes.

15 A. Right.

16 Q. Okay.

17 A. And those would survive in the plan from here on  
18 out, unless the operator had requested a change.

19 Q. Several of the face sketches you talked about MPs  
20 and EPs. What would be the difference between an EP,  
21 or evaluation point, or an MP, measuring point?

22 A. An evaluation point is in lieu of travel. It is  
23 quantity, quality and direction. It is a requirement.  
24 It's a nomenclature that exists within the district  
25 prior to my arrival, but it is essentially the points

1 required by 75.364(a)(2)(i), (ii) and (iii), which  
2 would be where air enters a worked-out area and exits  
3 a worked-out area and measuring point location  
4 sufficient to assure that the bleeder is functioning  
5 effectively.

6 An MP is a measuring point. It has a different  
7 frequency. It is in addition to travel, not in lieu  
8 of travel, and so it would also be quantity, quality  
9 and direction. Now, in this particular requirement in  
10 this plan, I believe that it requires MPA and MPB to  
11 be a daily check, that they would always check air  
12 going into the worked-out area. And then the EPs at  
13 the active longwall face would check air entering the  
14 worked-out area. And then the EPs on the bleeder,  
15 where air exits a worked-out area, into the bleeder  
16 air courses, is the area where weekly you --- you're  
17 required to check where air exits the worked-out area.  
18 And then on to the maps ---.

19 Q. I have another quick question.

20 A. Sure.

21 Q. Your MPs on your face sketches, MPBs, you show  
22 basically a location, could be three or four entries.  
23 Would that requirement then --- that measurement would  
24 have to be made in each of those entries?

25 A. I agree, yes. They would need to be.

1 Q. Back to that plan then. Basically that plan  
2 provided --- allowed the longwall to go on line and  
3 start up, so it did, and the development of the future  
4 gate entries, Headgate --- HG 22 or HG 23; is that  
5 true?

6 A. Yes. This plan actually requires something in and  
7 above the regulation. It's something I had asked for  
8 verbally. And at the bottom of the --- I guess it's  
9 the page --- at the top it says Northern District  
10 Longwall Bleeder System. At the bottom it described  
11 MP will also be established along the headgate  
12 entries, starting at the setup face and at intervals  
13 of approximately 2,000 feet. And what that is, is  
14 these MPs were to survive until the second panel had  
15 pulled past them. They showed in this plan that they  
16 would maintain --- and I turn to the face sketch here  
17 --- typical longwall face ventilation. They're  
18 showing that they're going to maintain a return  
19 stopping line in the Number --- between the Number Two  
20 and Number Three entry at the headgate. And what  
21 those MPs are for is, they're strategically placed  
22 every 2,000 feet. So as they're mining the subsequent  
23 panel, they can cross that into the center entry and  
24 check that for methane accumulation, to assure that  
25 the previously mined-out panel is not having a

1 substantial methane accumulation adjacent to the  
2 active longwall. And that's a safety enhancement in  
3 and above that that I --- that's required in the  
4 regulation. Again, it's described on the page that  
5 says Northern District Longwall Bleeder System, at the  
6 bottom of the page and the top of the following page.  
7 This plan also has several large maps with it.

8 Depicted the crossover mining. Here it's entitled  
9 panel two crossover and panel three crossover and also  
10 the mining of the Headgate Two North, Headgate Three  
11 North, and gives a sequence of mining. The primary  
12 and secondary escapeway is marked in green and in  
13 yellow. We look at these routinely to assure that  
14 they are isolated, that we don't have any potential  
15 issues with regard to the escapeway.

16 It looks like a portion of these maps are actually  
17 cut off. The title blocks are missing.

18 Q. I apologize if they are.

19 A. It doesn't look like it's going to interfere with  
20 what we're doing here today. However, let me ---  
21 nope. I stand corrected. I'm sorry. They're  
22 actually accurate. The mine operator submitted them  
23 this way.

24 And I'm looking at phase two, starting longwall,  
25 which shows opposed exhausting fan locations, 300,000

1 cfm. According to the verbiage in the plan, that was  
2 to be on line prior to the starting of the longwall.  
3 It shows the neutral air courses in the tailgate as  
4 well as an isolated return off of the panel one  
5 crossover mining. And it is shown with dash  
6 projections, which comes down, across the set of  
7 overcasts near the longwall stop point, and along the  
8 Number One and Number Two entries, up the tailgate,  
9 isolated from the tailgate system in its entirety, all  
10 the way back to a regulator, which describes 30,000  
11 cfm, which would be air coming from the panel to  
12 crossover development mining, separate from the  
13 longwall mining system, which is something that we had  
14 had discussions about with the operator. We did not  
15 want to commingle return air from any development  
16 section with the tailgate or the headgate air from the  
17 longwall due to potential contamination concerns. And  
18 this plan shows it as being isolated.

19 And there's an additional map in here that shows  
20 the sequence of mining for the longwall, which is  
21 hatched in green. It shows the location of MPB, EP  
22 LW2 and MPA. A 30,000 cfm regulator from the air  
23 coming off of panel one crossover is also shown, still  
24 isolated in its entirety from the longwall to assure  
25 that contamination does not occur. It also shows, via

1 red numbers one, two, three, two and four on the upper  
2 end, the sequence of mining for development of the  
3 longwall headgate panels --- or headgate development  
4 entries. They were showing a four-entry system at the  
5 time, which changed at a later date. It also shows  
6 the MP at Crosscut 58 and an MP at Crosscut 36, which  
7 are supplemental to the requirements of the  
8 regulation, to assure that air is moving in the proper  
9 direction; quantity, quality and direction.

10 MR. STOLTZ:

11 Terry, instead of going over every plan,  
12 maybe after each plan ---?

13 MR. FARLEY:

14 Okay.

15 RE-EXAMINATION

16 BY MR. FARLEY:

17 Q. The map you just had out here, you showed some of  
18 the future longwall gate entry development  
19 projections. And you said that initially the  
20 projections said three-entry development that was  
21 later changed --- initially showed four and was later  
22 changed to three.

23 A. Uh-huh (yes).

24 Q. Any particular reason?

25 A. I never received a reason on that. It's certainly

1 the operator's choice as to what he needs to do. I  
2 can only guess that is to assure the development would  
3 be faster. It's certainly quicker to mine three  
4 entries than it is to mine four. But again, I've  
5 never been given that from anyone.

6 ATTORNEY WILSON:

7 Jim?

8 RE-EXAMINATION

9 BY MR. BECK:

10 Q. Basically the question I had in mind about what  
11 determined or who determined three or four entries,  
12 and you answered it. But I guess one question I would  
13 have is, which one would provide a more stable  
14 ventilation system?

15 A. It really depends on the nature of the coal mine.  
16 Certainly more entries are more passageways for air.  
17 However, it depends on the characteristics of the mine  
18 as to whether or not those entries will be stable and  
19 the long-term stability. I would leave that best up  
20 to the mine operator because they have more experience  
21 in that coal seam than any regulatory agency.

22 Q. Most mine operators probably would lean towards  
23 the three entry because it's faster, can develop it  
24 faster?

25 A. Officially, less entries sometimes are more stable

1 with regard to large blocks. There's a lower  
2 extraction ratio. There could be a lower extraction  
3 ratio. But certainly it would take less time to  
4 develop.

5 MR. BECK:

6 Okay. That's all.

7 RE-EXAMINATION

8 BY MR. STOLTZ:

9 Q. I guess if I heard you right then, that provided  
10 the opportunity for the operator to put the longwall  
11 --- start the longwall. Bandytown fan then was  
12 started sometime before the longwall was in operation?

13 A. Yes. I visited the mine while the headgate was  
14 being developed because they had air issues to  
15 resolve, orders issued by the field office. And I  
16 traveled the headgate --- intake of the headgate  
17 development prior to connection with the Bandytown  
18 fan, I don't know, it was sometime prior to August.  
19 And I traveled it myself. I took a team of  
20 inspectors. As a matter of fact, specialists from  
21 within my division. And we --- I had people travel  
22 the tailgate, the tailgate connector that's diagonal.  
23 It's on the upper left inby the start of the longwall.  
24 I also had people on the crossover section, as I  
25 recall. And the reason for low air was they had

1 reached essentially the limits of the pushing  
2 ventilating fan at North Portal. And any leakage that  
3 they had in the air courses going up to the working  
4 section was of importance because they were also  
5 having --- rumored to have methane issues. And I  
6 believe those have been cited by the field office. So  
7 I traveled those in its entirety. We issued several  
8 violations that day, just maybe one or two. There  
9 wasn't a whole lot going on, and I don't recall that  
10 the working section actually ran. We did take last  
11 open crosscut measurements.

12 I visited this mine additionally September 1st of  
13 2009, again, with several of my ventilation ---  
14 actually, I believe I had one, Michael Haynes, with  
15 me. And the longwall change was supposed to have  
16 occurred. That is, the regulators that were to be  
17 tailgate EPs for air exiting the worked-out area and  
18 the headgate EPs for air exiting the proposed worked-  
19 out area. The longwall had not started mining yet.  
20 The Bandytown fan was on line.

21 I visited the mine. The regular CMI, or coal mine  
22 inspector, was Joey Athey. And the reason I went  
23 there was due to ---. He had issued several orders  
24 throughout the regular inspection, and we talked on a  
25 regular basis, and he would tell me his concerns about

1 the mine. And prior to the startup of the longwall, I  
2 wanted to assure that the air was correct. I traveled  
3 to approximately Crosscut 80. At that time there was  
4 a double door which separated the Number One and  
5 Number Two entry or the Number Two and Number Three.  
6 I'm uncertain which one. But the track, I believe,  
7 came up to the Number Two entry at that time, yes.

8 I traveled through a double door, and soon upon  
9 traveling through the double door, the air hit me in  
10 the face, where it should have hit me in the back, and  
11 the system was reversed. I issued a violation, an  
12 actual (d) order, pursuant to 75.324, intentional  
13 changes in mine ventilation. The changes, as required  
14 by the August 6th plan, had not yet been completed.  
15 However, working areas of the mine with reactivated  
16 power was in those areas where the mine was operating.  
17 There were two Joy miner reps, miner operators,  
18 allowed to come underground with me, unbeknownst to me  
19 that their air change wasn't completed until I found  
20 this condition.

21 Additionally saw an electrician working on a stage  
22 loader, with a longwall coordinator, I believe was his  
23 title at the time, Jack Roles. I asked Jack what was  
24 going on. I asked Jack what was going on. He replied  
25 that his air was all messed up.

1 After traveling that area and taking air  
2 measurements at the stage loader in the Number One and  
3 Number Two shields, I tried to look behind the  
4 longwall to examine the evaluation points that would  
5 become EP TG1. And the two temporary regulators, all  
6 the controls had not been constructed. I came back  
7 and I issued a mine-wide Withdrawal Order pursuant to  
8 the (d) order written with 75.324 --- written to  
9 75.324.

10 Jack Roles called the company president, Chris  
11 Blanchard, and I informed him of the mine-wide  
12 withdrawal. We came outside and reduced our citations  
13 to writing and hung a red tag over the drift mouth.  
14 The mine was down four days in order to complete the  
15 required air changes and come in compliance with the  
16 August 6th revision.

17 Q. I guess Bandytown was on line at that time?

18 A. Bandytown was on line at that time, yes, sir. And  
19 it was prior to the longwall startup.

20 Q. It took four days for them to abate that citation?

21 A. Yes, sir.

22 Q. Doesn't that seem kind of lengthy?

23 A. I think it goes to substantiate the --- it goes to  
24 substantiate the existence of the citation itself,  
25 that there were substantial changes yet to be made.

1 The longwall was not operating at that time, ---

2 Q. Yes. It was in the setup mode.

3 A. --- but there were people up there working and  
4 they were not working on ventilation controls. And  
5 that's in defiance of that reg, which requires only  
6 persons necessary to change the ventilation.

7 MR. FARLEY:

8 Can I interrupt one second? Did you say

9 air was hitting you in your face as opposed to at your  
10 back?

11 A. Yes, sir.

12 MR. FARLEY:

13 I'm sorry.

14 A. It was flowing from the longwall tailgate towards  
15 the longwall headgate, as opposed to headgate to  
16 tailgate.

17 BY MR. STOLTZ:

18 Q. Were they close to being able to fire up the wall  
19 at that time?

20 A. It appeared they were. The stage loader was in  
21 place. The shields were in place. The pan line was  
22 in place. However, power was disconnected and ---  
23 exactly how far --- of course, there's a lot of small  
24 things on the longwall that need to be in place prior  
25 to starting. And not being a longwall electrician, I

1 can't tell you what minor things were there, but I  
2 just heard there was an electrician up there working,  
3 doing non-ventilation-related work.

4 Q. Do you know when the wall was actually ---  
5 longwall was started?

6 A. It was started approximately September 4th,  
7 whenever that (d) order was terminated. And there was  
8 a subsequent (d) order issued for improper controls by  
9 Michael Haynes, and that was also on September 1st.  
10 There were two (d) orders issued, one by me and one by  
11 my employee.

12 Q. Okay. Well, I'm ready to move on to the September  
13 11th plan. I guess if you could just kind of explain  
14 the September 11 approval, which was an annual  
15 ventilation map which incorporated, I guess, several  
16 revisions.

17 MR. BECK:

18 What date is that?

19 MR. STOLTZ:

20 September 11th, 2009. And this is the  
21 second submittal of the annual ventilation map.

22 BY MR. STOLTZ:

23 Q. If you read it, it incorporates those.

24 A. I had requested an additional face plan due to  
25 numerous revisions which were in existence. Their

1 base plan went back to 2005. It was somewhat dated.  
2 The revision of August 6th didn't necessarily agree  
3 with their previous base plan in that it required  
4 additional safety enhancements, additional evaluation  
5 points, measuring point locations. So in order to  
6 essentially hit the reset button on the ventilation  
7 plan at this mine and get one document that contained  
8 it all, I had requested this ventilation plan. It  
9 was, again, approved on September 11th, and it was  
10 specific to the requirements of 75.370, as well as the  
11 requirements of 75.371.

12 And this ---. I don't have a review sheet with  
13 this one, interestingly enough, that shows who  
14 processed it within the district, but I require if it  
15 contains a map, we have a checklist, pursuant to  
16 75.372, which is checked off within the district.

17 Q. Back up. There probably was additional maps with  
18 it, but I did not copy all the maps. I'm sorry.

19 A. Oh, okay. Yeah, there's no large annual map with  
20 them. But we would do a checklist to make sure it  
21 complies with all the requirements of 75.372, with  
22 relation to boreholes, gas wells, air courses, air  
23 readings, et cetera.

24 Additionally, we have a checklist, pursuant to  
25 75.371, which is for the plan content, which is

1 typically shown in these eight and a half by 11 sheets  
2 of paper that you've given me. This one appears that  
3 the plan was worked on by Matt Walker, who is an  
4 additional person who worked on the plan to add to  
5 that previous statement that I had given. And they  
6 also have another engineer called Heath Lilly, who may  
7 occasionally work on plans. But they all three work  
8 for Route 3 Engineering, as I understand it. The  
9 title page for this or submittal page says Eric Lilly,  
10 but within the body of the plan it says individual  
11 submitting the plan information was Matthew Walker.

12 And it goes through general plan requirements. It  
13 has sections of the regulations with regard to the  
14 company's submittal, how they'll determine ambient  
15 level of carbon monoxide, typical face sketches for  
16 development of multiple entry development sections,  
17 typical face sketching for pillaring. And of course,  
18 this would be in areas that aren't longwall mined.

19 Page five, six --- starting on page seven,  
20 extending through --- extending through page 20, is  
21 the evaluation of pillared, worked-out areas with  
22 regard to remove pillars. Starting on page 21, it's  
23 the evaluation and bleeder typicals for non-pillared,  
24 worked-out areas. That extends to page 29. And then  
25 from page 30 through 36 includes the items specific to

1 the longwall, including page 36 is the line diagram  
2 which shows inlet and outlet EPs for each worked-out  
3 panel, including the panel which the accident  
4 occurred, Number One North, as denoted on page 36,  
5 through panel five. And it was my understanding from  
6 the mine operator that that is the total amount of  
7 panels that would be mined on that district.

8 Q. So it's my understanding then basically it took  
9 the August 6th, 2000 mine plan, that revision, and you  
10 incorporated it into this plan here?

11 A. Yeah, one single base plan that would replace the  
12 previous plan. Now, there is a plan that, prior to  
13 this, as a result of a letter that I had written to  
14 the mine operator, and that plan is not to be  
15 superseded or marked, do not supersede, within our  
16 files here in the district with regard to the water in  
17 the adjacent sealed area and the barrier necessary to  
18 assure that an inundation could not occur. And that's  
19 not part of this, but that was still outstanding in  
20 their file at that time and would stay that way.

21 MR. STOLTZ:

22 Okay. Terry, questions?

23 RE-EXAMINATION

24 BY MR. FARLEY:

25 Q. Let me go back over this order you wrote on

1 September the 1st, '09.

2 A. Yes, sir.

3 Q. If I understood you correctly, that condition  
4 existed because of some controls over on what was to  
5 be the tailgate side had not been completed yet?

6 A. Yes.

7 Q. All right. But it did occur --- your order was  
8 issued before the longwall actually commenced  
9 operation?

10 A. Absolutely. And at that time we issued that  
11 violation with a high degree of negligence but a low  
12 degree of likelihood because we didn't measure any  
13 methane that day.

14 Q. Okay.

15 A. No dangerous amounts, I mean, very minimal. I  
16 don't remember the amount, per se, but certainly my  
17 notes for September 1st would show that, as well as  
18 the notes of Michael Haynes. And that's why we issued  
19 it non S&S.

20 Q. Okay.

21 A. And the longwall wasn't operating, so it was  
22 giving credit for that.

23 Q. Had not started up yet?

24 A. Sure. It's essentially the same as checking  
25 emissions in a car before the car has been started.

1 MR. FARLEY:

2 Okay. Very good. Thank you.

3 MR. STOLTZ:

4 Jim?

5 RE-EXAMINATION

6 BY MR. BECK:

7 Q. Do you know on these two orders if Massey  
8 contested 'em and they're tied up in litigation?

9 A. They actually were contested, and I was at one  
10 point notified of that from someone at the Solicitor's  
11 Department.

12 MR. BECK:

13 Okay. Before we move on, are you okay?

14 Do you want to take a five-minute break or ---?

15 A. Sure.

16 MR. BECK:

17 Okay. Off the record.

18 SHORT BREAK TAKEN

19 ATTORNEY WILSON:

20 Let's go back on the record.

21 RE-EXAMINATION

22 BY MR. STOLTZ:

23 Q. Before we continue, I have three follow-up  
24 questions, Joe. Did the company conduct a ventilation  
25 simulation prior to the installation of the Bandytown

1 fan?

2 A. I don't know.

3 Q. By that, I don't know, I guess ---?

4 A. I don't know if they did or not, ---

5 Q. Okay.

6 A. --- because they didn't submit anything to me.

7 Q. Okay. Were the other sections allowed to work  
8 during the correction of the --- to the ventilation  
9 citation?

10 A. No. I ordered a mine-wide withdrawal. The area  
11 and equipment affected was the entire mine. And my  
12 red tag, as placed at the mine drift mouth, was to  
13 prohibit that exact practice.

14 Q. Okay. So they were down for the entire time of  
15 the three or four days?

16 A. Yes. What I was seeking was full compliance with  
17 75.324, which says that the entire mine will be  
18 evacuated and power would not be --- or power would be  
19 removed to the affected areas.

20 Q. Could you, I guess, talk a little bit about the  
21 --- I guess the water over the --- over mining ---  
22 over the mining of the --- in the Powellton seam, I  
23 believe?

24 A. I don't have a map, per se, of the water in the  
25 Powellton seam. Now, the water adjacent that I

1 mentioned earlier is in the old longwall panel, which  
2 according to this map, appears to have been mined  
3 March 2000 to November of 2000. And during either  
4 talking with the field office inspector assigned to  
5 the mine at the time or looking at a map, I can't  
6 really be sure, I recognized that they were mining  
7 precariously close to a water accumulation in this  
8 adjacent sealed area. And I became concerned with it,  
9 and I did not want a repeat of the Quecreek accident.

10 So I submitted a letter to the operator,  
11 requesting that an immediate revision be conducted,  
12 which would limit the mining extraction in the area of  
13 this water and provide an engineered barrier to assure  
14 that there is no blowout potential due to the static  
15 load of the water on the mine barrier between the  
16 active and the inactive sealed area and to minimize  
17 seepage. And that letter is available in our files in  
18 District 4. I don't know if you received a copy, but  
19 I believe that it's been scanned for transmittal. And  
20 they did a revision pursuant to that. And I believe  
21 they also revised their projections, because it  
22 appeared that mining would have encroached upon that  
23 barrier had I not sent that letter in order to prevent  
24 an accident.

25 Q. Okay. I guess in follow-up to what I just

1       previously asked you, how does the district, I guess,  
2       handle, in this case where you have a mine that has  
3       potentially, what, five other mines above it? I mean,  
4       you've got areas that are sealed potentially that  
5       could accumulate water. You have active areas above.  
6       I mean, I guess ---.

7       A. How we handle it is that during the 75.372 annual  
8       ventilation map, as it's submitted, each year we look  
9       at the overlying mines to see if there is a problem  
10      with them. Some are active. Some are inactive. The  
11      inactive mines, you don't know as much about as, say,  
12      an active mine because they're also submitting an  
13      annual ventilation map. There's some local knowledge,  
14      you know, just from working within the district that  
15      you gain over time, and I rely upon that of my plan  
16      reviewers who have dealt with the mines for a period  
17      of time. And you look at that overlay map on an  
18      annual basis, but additionally a requirement under  
19      75.1716 for mining under bodies of water, it is the  
20      mine operator's responsibility to make MSHA aware of  
21      such potential and to get a plan approved prior to  
22      doing that.

23     Of course, with the intimate knowledge that the  
24     mine operator has of the mine, they should always be  
25     aware of any potential overlying bodies of water.

1 That's why it's their requirement.

2 Q. I'm ready to start on the next approved plan.

3 This would be the September 18th, 2009 plan. It  
4 contains about constructing two regulators between  
5 breaks 33 and 34 in the tailgate One North. Would you  
6 just briefly go over it?

7 A. Okay. Looking at the plan review transmittal  
8 sheet, and it states 9/14. It was actually received  
9 on the 14th, reviewed by Specialist Mike Haynes on the  
10 14th. He was one of the gentlemen who was with me on  
11 September 1st, so he had in-line knowledge.

12 Additionally, he did the specialist supervisor review,  
13 which would normally have been done --- he did that  
14 for me on the 17th. Evidently I was out of town, and  
15 he would be the one that I would normally name acting  
16 in my place. So I have not done the review of this  
17 initially. Now, I have read it since it was approved.

18 And the operator had submitted to install two  
19 regulators between breaks 33 and 34, tailgate One  
20 North. Regulators will be installed in entries Four  
21 and Five to limit the amount of neutral air going to  
22 the longwall tail. At the current time the Upper Big  
23 Branch Mine does not have a miner's representative.  
24 If you have any questions or concerns, call me, Eric  
25 Lilly, who submitted it. And it appears that they're

1 limiting the amount of air going to the longwall tail  
2 from the neutrals, which is actually off of an intake  
3 split --- or a neutral air course in the Number Three  
4 entry to 75,000, feeding these parallel neutrals,  
5 which would be near spad 22417. There's five neutral  
6 air courses along tailgate One North.

7 Q. And that was done before?

8 A. I think that was done because they were losing too  
9 much air in their neutrals or maybe having a  
10 possibility of a problem with their ---. One of the  
11 times that Mike Haynes and I went to the mine, and I  
12 don't know if it was --- I think it was September 1st,  
13 we checked the neutral air course at the intersection  
14 they call the Ellis Switch, and that's essentially  
15 where the North Mains --- the mains that run  
16 north/south meet this Number Five North belt. Do we  
17 have a larger map? Yeah, right in that general area  
18 where your finger is, and it would be where Ellis  
19 Mains meet --- it would be where the Ellis Mains meet  
20 the Number Four North belt area. There's a junction  
21 right there. And in particular, we traveled up by the  
22 seals, seat set 9, 10, 11, 12 and --- somewhere in the  
23 seal set 13 area we had issued a violation at an  
24 overcast. That was just off the intake, and the  
25 pressures were reversed here. It wasn't functioning

1 as specified in their approved ventilation plan, so we  
2 issued a violation here. It appeared that the neutral  
3 air courses weren't flowing properly.

4 And that was the company's fix, was to put  
5 controls up here on that plan, at the Tailgate One  
6 North. So those controls were in response to that  
7 violative condition. And there was a citation issued  
8 by, I believe, Mike Haynes on that.

9 ATTORNEY WILSON:

10 Just for the record, you're referring to  
11 a map on the wall which is a one inch to 500 foot  
12 scale. And the area you're referring to is where the  
13 North belt mains intersect the ---.

14 A. It's a set of mains running north/south.

15 ATTORNEY WILSON:

16 It's marked Number Three North belt?

17 A. Yeah, Three and Four North belt intersections.

18 ATTORNEY WILSON:

19 That's near the set 13 seals; is that  
20 right?

21 A. Yes. But it wasn't in that return air course. It  
22 was actually the neutral air course, which was another  
23 stopping line to the east. And there was a violation  
24 issued for that, for that area.

25 MR. STOLTZ:

1 Terry, any follow-up?

2 A. I want to point out, too, that this plan actually  
3 is just to put those controls in, and it estimates  
4 75,000. There is no minimum requirement by the  
5 district. There is no actual number required by the  
6 district. And this control was not required by the  
7 district. It was just a means that the coal company  
8 used to abate the citation.

9 EXAMINATION

10 BY ATTORNEY WILSON:

11 Q. Let me just ask a follow-up here. In that plan  
12 revision, the regulators that you referred to, are  
13 they located on the map that's in front of you here?

14 A. No. They've since been changed. There is ---  
15 it's essentially totally different.

16 Q. Okay. Why don't we just --- let's get the green  
17 pen there and just in a large circle with the  
18 highlighter just circle the general area where those  
19 regulators are located, just so that we can compare on  
20 this map the plan. Okay. And let's put an arrow and  
21 put out here --- what was the date of that, 9/15?

22 A. September 18th, 2009.

23 Q. 9/18. Okay. So just put 9/18 plan.

24 WITNESS COMPLIES

25 (Mackowiak Exhibit One marked for

1 identification.)

2 ATTORNEY WILSON:

3 Okay. And that's on the map that's been

4 marked Exhibit Mackowiak One, just so that we can have

5 a large-scale reference to the plan that you were

6 referring to.

7 MR. STOLTZ:

8 I don't have anything. Terry?

9 MR. FARLEY:

10 No.

11 MR. STOLTZ:

12 Jim?

13 RE-EXAMINATION

14 BY MR. BECK:

15 Q. Just a couple follow-ups. I need to back up a  
16 little bit. On your inspections on the longwall face  
17 you typically measure air quantities?

18 A. Yes. Typically in the methane dust control plan  
19 there's a requirement for the air quantity at the ---  
20 near the head. It will give a certain shield number  
21 and also at the tail. I never inspected this longwall  
22 while in operation, so I can't tell you exactly what  
23 their plan requirements are, but they're typically  
24 given in velocities in lieu of volumes because it's  
25 difficult to get a proper area across the longwall

1 face.

2 Q. Okay. And had you ever noticed any cracks in the  
3 roof or floor from undermining or overmining that may  
4 indicate or --- allow gas to come through?

5 A. During my travels in this area, I did not observe  
6 any of those. Now, again, I wasn't there as the  
7 longwall was operating. I did have specialists there  
8 after the fact.

9 Q. If I understood you right, you said that an  
10 operator had to have a plan if they were mining under  
11 a known body of water?

12 A. Yes. 75.1716 is a regulation which requires it.

13 Q. And what about if there wasn't a known body of  
14 water, just an abandoned mine or an active mine above  
15 it or below it, do they have to have a plan for that?

16 A. If it has a potential to impound water, yes.

17 Q. Only if that potential exists?

18 A. Correct. If it is dry, then the requirement would  
19 not be made. Now, when we evaluate the bleeder plan  
20 we take into consideration overlying mines as well,  
21 looking at that annual 75.372 map in order to  
22 determine if we would have active caving from one mine  
23 to the other that may impact the ventilation system.

24 In the case of this mine, they had had extensive  
25 previous mining prior to me becoming a ventilation

1 supervisor. And one of the guys who was in --- who  
2 was a reviewer had knowledge of this area down here,  
3 mined prior to November 2000. And that didn't appear  
4 to be an issue, so of course it wasn't a concern of  
5 mine, ---

6 MR. BECK:

7 Thank you.

8 A. --- due to the history.

9 RE-EXAMINATION

10 BY MR. FARLEY:

11 Q. Joe, the regulator or regulators you just circled  
12 in green on the large map, does this large map match  
13 the September 18, 2009 ---?

14 A. No, it does not. No, it does not. But also this  
15 map has some --- well, it shows a door in that  
16 location in lieu of a regulator, which would decrease  
17 the volume of air going out to that area. Not a major  
18 concern initially to me, unless they were having  
19 problems within that air course. Only the mine  
20 operator would have this knowledge or someone who had  
21 just inspected the area.

22 But there's also another revision that would  
23 impact this later on, and it's showing the tailgate  
24 stopping line adjacent to the longwall, with respect  
25 to that. And I believe that is in response to a

1 violation issued December 1st --- no, back in January.

2 MR. STOLTZ:

3 You have several plans you've gone  
4 through.

5 A. Yeah. Yeah. We'll get to that, though. I'm not  
6 really sure of the date that this plan that changed  
7 these controls came into effect, so there's --- this  
8 is the first plan for controls in the tailgate, and  
9 there's a subsequent plan at a later date, which I  
10 believe you have. We'll get to it.

11 RE-EXAMINATION

12 BY MR. STOLTZ:

13 Q. Joe, if I heard you correctly when you answered  
14 Jim's question is that you all require velocities made  
15 along the longwall face on the head and tail?

16 A. Yeah, near the head and near the tail. The shield  
17 number should be specified in the methane dust control  
18 plan.

19 Q. Thank you. And then your intake air quantity, you  
20 require an intake air quantity?

21 A. I do require an intake air quantity. It's on  
22 theirs as well. The minimum required by 75.325 I  
23 believe is 30,000. At this mine I would expect it to  
24 be higher.

25 Q. That intake quantity, where would you commonly

1 take it? Where is it made? Is there a difference  
2 between when you're using belt air or not using belt  
3 air?

4 A. You would have to take that belt air into  
5 consideration. However, the belt air regs themselves  
6 require that the intake air supplied to the longwall  
7 panel will be less --- the air coming to the longwall  
8 panel from the belt air course would be less than 50  
9 percent of the total, and that would be required. And  
10 it really depends on their methane dust control plan,  
11 what was specified in that, but you can certainly take  
12 it immediately outby the longwall face, in the Number  
13 One entry and also in the Number Two entry, where the  
14 crosscut --- as it's delivered into there. But it has  
15 to be taken outby these check curtains, as shown on  
16 this exhibit, Mackowiak One, that are shown in the  
17 One, Two and Three entries. They would have to be ---  
18 the actual air that enters the longwall face. So in  
19 this respect on this one, the crosscut immediately  
20 outby as well as this entry coming up the neutral,  
21 that has to --- that would encompass the intake air  
22 coming to the section.

23 Q. If belt ---?

24 A. If belt air was in use.

25 Q. If belt air was being in use, you'd add it. If

1 belt air is not being in use, you'd subtract from it?

2 A. Absolutely.

3 Q. Okay. I would like to, I guess, go over our plan  
4 that was approved then on September 24th, 2009. The  
5 plan was, I guess, to drill a 20-inch dewatering  
6 borehole, I'm gathering, here at --- this plan,  
7 apparently the wall had started sometime after  
8 September 1st --- well, you stated September 4th you  
9 believe the wall started. Then they must have  
10 encountered --- had some water problems and requested  
11 a dewatering hole.

12 A. In addition, I appear to have been off this day.  
13 It was assigned to Rick Kline for me, assigned by my  
14 supervisor. It is a plan --- an eight-inch pilot hole  
15 to be drilled initially and reamed out to diameter of  
16 20 inches. That has a safety precaution for when the  
17 hole reaches within a hundred feet of the mine, a  
18 regulator to assure that the air is not interrupted.  
19 And it contains a listing of equipment that has  
20 automatic fire suppression. In addition with that ---  
21 I'm assuming that's because they put their track  
22 travelway to the section in their intake, therefore,  
23 it would be required to have automatic fire  
24 suppression. And it has a map attached to it, which  
25 shows the location of the longwall at that time, the

1 last open break or intake air quantity of 68,175 cfm  
2 and the location of a single 20-inch borehole at the  
3 rear of the panel near the Bandytown shaft.

4 Q. I guess the water problem they were encountering,  
5 do you know where it was at that point in time?

6 Because they had to have water since they were putting  
7 a dewatering hole in.

8 A. Sure. To my knowledge, just through verbal  
9 communications with the inspectors and some of the  
10 plan personnel, that they had actually mined a sump  
11 back there, and this was to go into that sump and be  
12 countersunk into the floor. Now, again, I didn't  
13 approve this plan. But having read it here, it does  
14 not show any water accumulations anywhere, which would  
15 appear to misrepresent what was actually there,  
16 because you would certainly put a pump where a pump  
17 was needed. And therefore, you'd need water.

18 Q. Okay. That pump would be used, then, to get the  
19 water out of the mine, basically, a dewatering hole?

20 A. Correct. And I don't know --- this map also does  
21 not contain the elevations which would be pertinent  
22 for our use in determining where water accumulations  
23 are likely to occur.

24 Q. Okay.

25 MR. STOLTZ:

1 Terry? Jim?

2 MR. BECK:

3 I'll defer until later.

4 MR. STOLTZ:

5 Okay.

6 BY MR. STOLTZ:

7 Q. I guess the next plan would be an October 29th,  
8 2009 plan. It's a two-phase plan consisting of the  
9 One Right Crossover and installation and removal of  
10 some vent controls in the One Right Crossover. Also,  
11 I guess a question as we get into it, do you know when  
12 Headgate 22 section --- or sometimes it's referred to  
13 as MMU 029 or 001 section, when it was started?

14 A. I do not.

15 Q. Okay.

16 A. That's something --- when you do plans, they don't  
17 necessarily have a time period in which to be enacted.  
18 So I don't know how far in the future the mine  
19 operator is proposing these changes. You just look at  
20 it for face value, for what you get, and determine  
21 whether they materially ventilate or not. This plan  
22 was again processed by inspector --- or specialist  
23 Mike Haynes. And typically I like to keep the plans  
24 with the people who understand the mines. So after  
25 his mine visit, I tried to make sure that --- the best

1 reviewers are the people who have actually walked the  
2 air courses.

3 This plan revision appears to have been required  
4 because they were mining off of the panel one  
5 crossover, which is located approximately tailgate  
6 entry 31 --- or 30, running north and south. It  
7 actually turned and went east into the One Right  
8 Crossover. And I had asked at this time why this was  
9 necessary, and I believe it was either Matt Walker or  
10 Chris Blanchard indicated that they needed it for air.  
11 And I said, well, why? Do you need more air? Well,  
12 no, but we're going to turn at the intake. So being  
13 that we reviewed ventilation plans, additional intake  
14 is never a bad thing. So we looked at it, it  
15 ventilated, and we processed it and approved it.

16 And the letter from the operator --- this plan  
17 also, let me state, had some of the MIS or MSIS system  
18 plan detail within it, which actually just shows a  
19 legal ID report, and that was something I implemented  
20 during the time. You may see this intermittently  
21 through some of your plan readings, just to assure  
22 that we send the mine's response --- our plan approval  
23 or denial to the right location, and that's what  
24 that's for. But the mine operator submitted --- phase  
25 one shows the ventilation while mining and cutting

1 through. It's cut through, will be isolated and  
2 controlled. Regulators will be built on the inby and  
3 outby sides of the cut-through. These regulators will  
4 remain open to ventilate the area until immediately  
5 prior to cut-through. Of course, the concern is  
6 they're cutting through into an intake air course, and  
7 the contamination needs to be eliminated, and that  
8 would be the requirement for that.

9 Phase two shows the installation and removal of  
10 controls for One Right Crossover to create additional  
11 intake once the cut-through is complete and the  
12 section moves. Headgate Three North will be mined  
13 under longwall ventilation revision dated August 6th.  
14 So this doesn't change the ventilation revision which  
15 allowed the implementation of the longwall. It only  
16 was to provide additional intake entries.

17 Q. Would that be something that's typical? Do you  
18 see that often?

19 A. No, I do not see it often. I actually don't see  
20 panel crossover mines often at all. And I have asked,  
21 through verbal conversation with Chris Blanchard  
22 several times, why these crossovers were necessary to  
23 be mined since they weren't recovery entries. Now,  
24 typically when you see that, they're recovery entries.  
25 The longwall will mine into them, they have heavy roof

1 support, and that's for the recovery of the actual  
2 shields and pan line, et cetera. These panel  
3 crossovers are not mined for that because the longwall  
4 stop points, as shown on all the maps that have been  
5 submitted, don't mine into them. So on several  
6 occasions I've asked Chris Blanchard what's the  
7 purpose of these, and I've yet to receive an answer.  
8 I don't know. I can only look at a map, and it  
9 ventilates, so therefore I can approve it.

10 Q. Yes.

11 A. And likewise, I believe the One Right Crossover  
12 was mined to get the additional coal that would have  
13 been left in this wedge between the 6 North belt and  
14 the longwall.

15 Q. Well, that's what it appears.

16 A. That's the only logical answer that I can come up  
17 with. I've never been told specifically why, other  
18 than they said they were converted to additional ---.

19 Q. I guess as long as the vent controls are  
20 constructed correctly then, it shouldn't pose a  
21 ventilation hazard?

22 A. Correct. This area specifically, if you follow  
23 the return air course, it comes out of the One Right  
24 Crossover, down the panel one crossover, across two  
25 overcasts and across a regulator, into that isolated

1 split, which is within the tailgate Number One and  
2 Number Two entries. So therefore, it is isolated from  
3 the longwall itself, should have no effect if  
4 constructed properly, and therefore is not a  
5 contamination issue.

6 Q. Okay.

7 MR. STOLTZ:

8 Terry? Jim?

9 RE-EXAMINATION

10 BY MR. BECK:

11 Q. Joe, can you just touch on --- this is what's  
12 called a push/pull system; right?

13 A. It is.

14 Q. I guess because air is being pushed from Ellis  
15 Portal ---?

16 A. No, sir. Air is being pushed at the North Portal  
17 with a blowing fan, and that ---.

18 Q. Pulled at Bandytown?

19 A. And being pulled at Bandytown. And the Bandytown  
20 fan was added to the system that was already in place.  
21 And it was used previously in these previous panels  
22 that were mined out. I believe they had --- there's a  
23 12-foot ventilation shaft shown at the back end of  
24 this March 2000 panel.

25 Q. So how do you get that air to go --- how do you

1 control it going across the longwall face with that  
2 kind of system?

3 A. At some point you go from a positive pressure to a  
4 negative pressure past the zero point. And I'm  
5 assuming in this case, without putting a Mag-Gage on  
6 the stopping lines or taking a barometric pressure  
7 survey, that it occurred outby the longwall.

8 Q. Is this a --- would you consider this kind of a  
9 complex, unusual system?

10 A. Yes, it is complex and it is unusual. It has been  
11 used before. But certainly when you're doing a  
12 push/pull, things get more complex, yes.

13 Q. Do you know why MMU 040-0, why that started?

14 A. I'm sorry. Can you point to MMU 040-0? Oh, do I  
15 know why that started out?

16 Q. It just looks kind of odd sitting there.

17 A. It does. And it is odd. And I would like to  
18 point out that the projections --- and we'll get to  
19 that here in a moment, but the projections actually  
20 tie back into the existing longwall at approximately  
21 break 90. And I think right around December that will  
22 become evident, if you can just give me a little bit  
23 to get through that.

24 Q. Okay.

25 A. Because there's revisions involved, and that's

1 kind of an issue ---

2 Q. Okay. I got ahead of myself.

3 A. --- in and of itself. Yeah. Are we okay on One  
4 Right Crossover?

5 MR. STOLTZ:

6 I don't have any follow-ups.

7 MR. BECK:

8 I'm fine.

9 MR. STOLTZ:

10 Okay.

11 RE-EXAMINATION

12 BY MR. STOLTZ:

13 Q. Okay. I guess I'd like to go over then the  
14 approved November 13th, 2009 plan, which is for a  
15 panel two crossover to develop three entries for  
16 Headgate Two North.

17 A. Plan contains a portion of the legal ID, which we  
18 added to it. The actual submittal by the mine  
19 operator begins with the letterhead of Performance  
20 Coal Company, dated November 3rd, stamped received  
21 November 4th. It is a ventilation revision for the  
22 Upper Big Branch Mine for our review and approval.  
23 This revision is to show the ventilation scheme on the  
24 panel two crossover is completed, and mining begins on  
25 Headgate Two North. Now, the August 6th approval

1 actually had a sequence for the mining in the  
2 crossovers on the subsequent headgate panels. What  
3 this is, is essentially the mine operator changed  
4 their mind. They weren't going to follow that August  
5 6th. So in lieu of following it, which was already  
6 approved and on the books and understood as to  
7 function, they're now going to what we consider a  
8 site-specific revision. And it isn't a revision to  
9 the ventilation plan, per se, but rather to the map,  
10 and it's to show the changes on the air course. And  
11 it shows the isolated return off the section via  
12 overcasts on the large map.

13 The intake is in the Number Two entry, the center  
14 entry, the belt, and neutral is in the Number One  
15 entry, and the return is in the Number Three entry.  
16 And they overcast that return across and down to this  
17 isolated --- this map is outdated currently, the  
18 Mackowiak One. It's a later map than this. But there  
19 was an isolated return entry in the Number Three  
20 entry, the headgate at that time, that traveled the  
21 length of the longwall all the way back to the bleeder  
22 shaft. And this was connecting to that. This return  
23 right here, which is the Number One entry in the panel  
24 two crossover, was isolated in its entirety, and it  
25 does show the neutral airs coursing outby or south on

1 this map, as well as shows the primary intake  
2 escapeway in a green arrow. They elected to remove an  
3 isolation stopping between the neutral and the intake  
4 on the right-hand side of the map, and they were going  
5 to compensate with that with double doors, which would  
6 be required for traveling from one air course to the  
7 other in pairs under 75.333.

8 And essentially that's it. I mean, it was just a  
9 change in the way they were going to mine that  
10 crossover. It also estimates that the last open break  
11 quantity would be 25,000 cfm on MMU 029, which shows a  
12 tie from our plans to the methane dust control plans  
13 that the inspector on site could make to assure that  
14 the two plans coincide with one another. That's what  
15 that number is really good for. We always try to get  
16 it on there. Additionally, the LOB requirement is  
17 25,000. It is in excess of the minimum required by  
18 75.325, which is 9,000. So it was approved on  
19 November 13.

20 Q. Okay.

21 MR. STOLTZ:

22 Terry? Jim?

23 BY MR. STOLTZ:

24 Q. I guess the next approved plan would be the  
25 December 18th, 2009 plan revision, request to route

1 the travelable return air course from the active MMU  
2 040 and add a regulator.

3 MR. BECK:

4 What's the date on that?

5 MR. STOLTZ:

6 December 18th.

7 A. Now, between the date of November 13th and  
8 December 18th several items occurred at the mine with  
9 regard to the in-mine inspections. Specifically I  
10 believe the CMI is Kevin Lyall. He traveled this area  
11 around break 80 and cited bulging stoppings. And I  
12 don't know the exact citation number, but I believe  
13 it's somewhere around November 14th. He cited that,  
14 required those stoppings to be repaired. Additionally,  
15 I sent --- I believe it was Keith Sigmon to the area,  
16 who issued an (a) order on water in that area. They  
17 were --- the mine was requiring miners to travel  
18 chest-high water in order to set pumps and try to work  
19 on the condition. The ventilation controls had taken  
20 weight and there were some issues related to that.

21 And I believe they issued violations again on  
22 December 1st, possibly that (a) order right around  
23 there. Somewhere between December 1st and December  
24 14th, I believe, is when Keith Sigmon issued that (a)  
25 order for the area shown --- and I'm going to say from

1 break 90 to break 70, in that general area, in the  
2 Number Three entry of the headgate. This water was  
3 impacting the isolated return air course off of MMU  
4 029, which is the headgate section. Therefore, this  
5 December 18th revision was submitted. Additionally,  
6 this December 18th revision, I believe --- let me read  
7 it for a second.

8 WITNESS REVIEWS DOCUMENT

9 A. And he also states, the mine had submitted  
10 numerous plans prior to December 18th that may be of  
11 importance. And I have it here on a sheet of paper  
12 provided to me from you, Rich Stoltz. November 20th,  
13 December 1st, December 3rd, December 4th, three on  
14 December 4th. Again on December 9th and again on  
15 December 11th that were all denied. In fact, there  
16 were nine plans submitted that were all denied for  
17 various items across the entire mine. And the reason  
18 for denial of all these plans is listed on the plan  
19 itself and mailed back to the mine operator. We  
20 retain one for the record, and I believe we  
21 transmitted that to you as well. And I think at times  
22 those denials are of pertinent importance in that they  
23 show that the items that the mine operator would  
24 like --- steps that they would like to take that do  
25 not necessarily comply with the regulations or do not

1 materially ventilate the mine. And therefore, that is  
2 your two reasons to deny it, and we did do that.

3 Back to the December 18th revision.

4 BY MR. STOLTZ:

5 Q. If I heard you right, it was the vent controls  
6 that were separating the return air course to the gob  
7 was being compromised ---

8 A. Yes.

9 Q. --- and cited?

10 A. Yes.

11 Q. Okay.

12 A. Now, on December 14th, I received a citation from  
13 either the field office or my specialist, I'm not  
14 sure. And each time that our specialist would come  
15 back or I would send someone to a mine, I meet with  
16 them as soon as upon returning, sometimes late in the  
17 evening, sometimes the very next morning. They're  
18 required each time that they go to the mine to put a  
19 copy of the citations in my in box. I read them every  
20 time they come back to assure that we all understand  
21 everything. Because what goes on in a mine, if it  
22 needs a plan modification, the only way to get a good  
23 plan modification and to get quality within these  
24 plans is for me to understand that violated condition.  
25 And therefore, having discussions about it just only

1 helps for the abatement.

2 Furthermore, if someone issued a citation pursuant  
3 to an in-mine condition and a plan is required to  
4 abate it, I want to make sure that that plan, it meets  
5 their satisfaction. They saw the issue. They have  
6 the most intimate knowledge. So I did that each and  
7 every time that I had --- and I wasn't there, each and  
8 every time I had a specialist there.

9 On December 14th I received a citation for this  
10 area. And Specialist Keith Sigmon told me that, Joe,  
11 man, this area looks bad. And I said, how bad? Top,  
12 bottom, ribs? He said, yes. I said, will it ---  
13 could it satisfy the requirements of 75.384, longwall  
14 tailgate travelway, which is a means of emergency  
15 egress off the longwall? He said, I don't think so.  
16 So I immediately notified Chris Blanchard verbally,  
17 via telephone call, as soon as possible, that the  
18 conditions within this entry are not conducive to  
19 75.384. That was based on the discussions I had with  
20 Keith Sigmon. That's the beginning of the  
21 introduction of this mining right here, which later  
22 becomes the mine operator's response to that. And I  
23 believe it's a January 22nd revision that allowed that  
24 tailgate entry to --- tailgate mining to commence.  
25 Q. You're talking --- when you say right here, you're

1 talking about Tailgate 22?

2 A. Tailgate 22 development, which on this map,  
3 Mackowiak One, is denoted MMU 040-0. But that  
4 essentially began on December 14th. Now, what I did  
5 on December 14th to fully understand, I guess, the  
6 breadth of the situation was I took an overburden map  
7 of the area to roof control and I asked them politely  
8 to run ARMPS for me, which is a stability analysis.  
9 When they ran the stability analysis with no  
10 overmining, it showed stable. When they ran the  
11 stability analysis with overmining, which is the case  
12 due to the overlying Castle mines and maybe four or  
13 five others, it did not come back with the recommended  
14 long-term stability. Therefore, I picked up the phone  
15 and called Chris Blanchard to put him on notice.

16 Q. Basically you're saying the pillars were being  
17 done ---?

18 A. The pillars were too small, yes, which explains  
19 the bulging stoppings, as issued on November 14th by  
20 Kevin Lyall, and it explains the conditions issues by  
21 Keith Sigmon. Now, it doesn't explain the water.  
22 When looking at elevations of the mine map, you can  
23 see that there's a depression in the area and that  
24 water would be likely to accumulate.

25 Back to December 18th. The mine operator

1 submitted a change to the typical longwall face sketch  
2 in which it said stoppings will be removed at least  
3 every 600 feet to make entries common. Each stopping  
4 will be reconstructed to isolate the tailgate entry  
5 prior to mining second longwall panel. And the reason  
6 being is I believe that the mine operator no longer  
7 wanted to travel that air course in its entirety.

8 That would be the return air course off of Headgate 22  
9 down across these overcasts, which is near Tailgate  
10 22, and along the Number Three entry of the headgate  
11 due to both the water issues and the degrading ground  
12 conditions.

13 Q. He wanted to make it common with the longwall top?

14 A. Yes. Now, this ventilation revision requires air  
15 to be evaluated where it enters a worked-out area,  
16 pursuant to 75.364(a)(2)(i), and where air exits the  
17 worked-out area, pursuant to (ii) and (iii). It also  
18 had typical face sketch for gate road development for  
19 the three-entry system.

20 And we had been asking for at several times ---

21 and this was provided to me I believe from Matt  
22 Walker. Let me confirm that. Yes, Matt Walker  
23 submitted this plan. And I was asking for actual  
24 pressure drops and quantities at multiple locations to  
25 assure that this system would function for long term.

1 I did those verbally. And this page, which says Upper  
2 Big Branch and has a mine segment and gives distances,  
3 entries, areas, resistance, quantities, gains and  
4 losses, total head, to assure that we had enough head  
5 to functionally ventilate this area. And the operator  
6 did submit that and it was approved and included a fan  
7 chart, several fan charts, for the existing fan.

8 This was to reroute the continuous miner return.

9 Instead of exclusively along the Number Three entry of  
10 the headgate, it would allow a portion of that return  
11 to travel isolated along the Number Seven North belt,  
12 across the set of overcasts right here (indicating),  
13 where they estimate 35,000 cfm in this plan.

14 Q. When you say right here ---?

15 A. Right here would be at the beginning of Headgate  
16 One North. There's a regulator located with a green  
17 label that says estimating 35,000 cfm, across four  
18 overcasts, down along panel one crossover, across two  
19 overcasts, and back towards this isolated return  
20 split, which was the return for the area denoted on  
21 this map, MMU 040, which had 18,621 cfm at the last  
22 open crosscut. I think it's called the One Right  
23 Crossover mining. It was the one from the previous  
24 revision, that area right there at the mouth of the  
25 longwall panel, the mining in the wedge, that the

1 return off of this section would joint its section  
2 return and be isolated back towards the bleeder fan.  
3 But it also allowed a secondary return down the panel  
4 two crossover, which was isolated along ---. Let me  
5 read it. Just a second.

6 WITNESS REVIEWS DOCUMENT

7 A. Okay. I'm sorry. Let me stand corrected. I was  
8 getting ahead of myself. It actually allows an intake  
9 air course --- an additional intake air course to the  
10 longwall mining section along the Number Three entry  
11 to the longwall and to route this MMU 029 return air  
12 course down the mains and to join the MMU 040 return  
13 and into the Number One and Number Two entries of the  
14 return. And it's isolated back to the Bandytown fan.  
15 That's what it allowed.

16 BY MR. STOLTZ:

17 Q. The Headgate 22 return to join them?

18 A. Yeah. Headgate 22 return includes a face sketch  
19 for three entries.

20 Q. So it did away with the intake --- or the return  
21 coming up the Number Three entry ---

22 A. Correct.

23 Q. --- toward the allotted intake and rerouted to the  
24 return for that section?

25 A. Correct. Let me also state that it also reversed

1 the longwall belt air, which is of pertinent  
2 importance in that it's shown at break 52, coursing  
3 outby to a regulator located at Crosscut 11 and into  
4 that return as well, which would reverse and do away  
5 with the belt air requirement or basically come into  
6 compliance with the belt air regs promulgated December  
7 31st, 2008.

8 MR. FARLEY:

9 You said the plan reversed the belt air?

10 A. Yes. And the longwall at that time is  
11 approximately at break 52.

12 BY MR. STOLTZ:

13 Q. Also of importance with this plan is the last line  
14 on the third paragraph for the mine operator, it says,  
15 this will also show the dewatering system in  
16 place ---.

17 BRIEF INTERRUPTION

18 A. The mine operator's plan on --- the third  
19 paragraph, the last sentence, also states, this will  
20 also show the dewatering system in place to handle  
21 future inflows of water and to keep ventilation  
22 uninterrupted. And they show two three-inch air pumps  
23 at approximately crosscut 123 in the Number Three  
24 entry, two three-inch air pumps at crosscut 100, one  
25 three-inch air pump at crosscut 88. Hatch indicates

1 shoreline elevation. No areas are roofed to impede  
2 ventilation or travel. And that's in direct response  
3 to the violative conditions and specifically the (a)  
4 order that had been issued by Inspector Sigmon.

5 We wanted to assure that the air could flow and  
6 that there were no changes that could occur as a  
7 result of water accumulations. And that appeared to  
8 suffice, based on the evaluations.

9 Also shows a single 20-inch diameter borehole with  
10 a vertical turbine pump, which is in a previous  
11 revision located at break 131. I'd like to also point  
12 out it shows the intake to the longwall being 57,951  
13 cfm, which is in excess of the minimum 30,000  
14 requirement by the regulation.

15 MR. STOLTZ:

16 Terry?

17 MR. FARLEY:

18 No questions.

19 MR. STOLTZ:

20 Jim?

21 MR. BECK:

22 This is not a question for Joe, but we  
23 talked about overlays sometime in the past. I think  
24 we talked about seams underneath. I'd like to request  
25 a copy of any overlays that MSHA or the State --- the

1 independent team, that we can get copies of those  
2 maps.

3 MR. STOLTZ:

4 Thank you, Joe.

5 BY MR. STOLTZ:

6 Q. Okay. The next one, Joe, would be the --- I guess  
7 it was approved on December 23rd, 2009. It was a plan  
8 to implement The December 18th plan for belt air  
9 reversal and limit the exposure to miners for belt  
10 air.

11 A. I was in the office that day when Bill Ross and  
12 Chris Adkins, who I believe is a senior  
13 vice-president, and Chris Blanchard, I believe ---  
14 well, maybe not. I believe Bill Ross and Chris Adkins  
15 for sure. I'm not really sure about Chris Blanchard  
16 having brought this in. And as stated on the mine  
17 operator's submittal dated the 23rd and stamped  
18 received on the 23rd, on December 21st and 22nd this  
19 plan was attempted to be implemented. Due to the  
20 influence of the longwall bleeder fan, it was not  
21 possible to make the approved changes. Please find  
22 attached an interim ventilation revision to allow the  
23 belt air to course towards the longwall face. Belt  
24 air will travel inby from near crosscut 25 on the  
25 Number One North headgate. The remainder of the belt

1 air will travel outby through a belt regulator and  
2 into the return.

3 The below procedures will be followed during the  
4 time while belt air is being utilized in the face at  
5 the One North longwall panel. The entire length of the  
6 belt conveyor system from the split point inby to the  
7 longwall face will be traveled every two hours.

8 Results of this examination will be communicated to  
9 the longwall foreman at the end of each inspection. A  
10 box check will be installed to the longwall tailpiece  
11 and near 029-0 MMU belt drive to limit the quantity of  
12 belt air traveling inby. All personnel working on the  
13 One North longwall panel will be informed of this  
14 ventilation change.

15 In addition, within 30 days of approval, a long-  
16 term ventilation plan will be submitted to your  
17 office, which will show long-term solutions to allow  
18 belt air to travel outby as well as to open intake air  
19 courses. The safety precautions will ensure equal or  
20 greater protection for members working on the longwall  
21 section. This mine currently has no miners' rep.  
22 Again, ---.

23 Q. I guess what I just heard, Gerry (sic), is they  
24 tried to implement the December 18th plan where --- to  
25 have belt air go outby. And they were not --- they

1 could not do that, so they're requesting another plan  
2 on December 23rd now, with added safety procedures?

3 A. Correct. And it was hand delivered by Bill Ross,  
4 with Massey Coal Services, as well as Chris Adkins,  
5 senior vice-president of Massey Energy, which is quite  
6 odd to have such high-ranking individuals come in and  
7 hand deliver a plan and request an immediate meeting.  
8 So certainly that was granted. And we reviewed it on  
9 the spot. And I was there and I believe Rich Kline as  
10 well, and possibly Luther Marrs --- or Link Selfe.  
11 Excuse me, not Luther Marrs.

12 And we reviewed it and --- they had attempted the  
13 reversal, and it did not occur, so this was purely  
14 their plan. Eric Lilly was in attendance as well, as  
15 noted by his change on the map. And my only concern  
16 upon reviewing this was that they show compliance with  
17 the 50 feet per minute CO monitor rule, because CO  
18 monitors are in use in the mine. And any time you get  
19 less than 50 feet per minute, you get a reaction time  
20 issue to those sensors.

21 He added that, and it was subsequently approved.

22 It was --- and a plan was drafted, developed by the  
23 mine operator in response to the difficulties. And  
24 considering the fact that they had actually followed  
25 75.324, as far as I knew, and implemented it and it

1 didn't function, then I think it was pertinent that we  
2 entertain it, you know, for safety of the miners.

3 MR. STOLTZ:

4 Terry? Jim?

5 BY MR. STOLTZ:

6 Q. You need a little break? Joe, you want a little  
7 break?

8 A. No, I'm okay. I'd like to also point that I'm not  
9 aware --- I was under the impression, of course,  
10 within the plan, on this December 23rd plan, that a  
11 long-term solution to allow belt air to travel outby  
12 as well as to open more intake air courses would be  
13 submitted. I don't recall we ever got that long-term  
14 solution submitted by the mine operator.

15 Q. Within the 30 days or ---?

16 A. Within or outside the 30 days. Additionally ---  
17 as far as their need for additional intake air  
18 courses, it wasn't conveyed to me during that meeting  
19 that they had any air problems. And the air volumes  
20 as shown on this map are nearly double the minimum  
21 required by Federal regs.

22 Q. Okay. The next plan would be the approved plan on  
23 January 5th, 2010, vent controls being installed and  
24 removed for shearing blocks for the new longwall belt  
25 to Headgate Two North.

1 A. A fairly small revision and purely shows an area  
2 that will be mined near crosscut 135, directly  
3 adjacent or to the east of the Number One Headgate 22  
4 development section, which contains their belt  
5 neutral. And it shows where they're going to mine in  
6 order to connect the future longwall belt into the  
7 mainline belt, which is contained within Number Seven  
8 North belt, near the Glory Hole. And it was to show  
9 isolation controls to assure that return air from this  
10 mining doesn't course down the neutrals, which were  
11 going outby, over non-permissible equipment. And it  
12 required the construction of a box check to assure  
13 that that didn't occur, because it was mining in a new  
14 area and would subsequently require a primary and  
15 secondary escapeway, as well as isolation controls, to  
16 assure that contamination does not go from the mining  
17 area into the belt neutrals. That's the purpose of  
18 that plan.

19 And interestingly enough, phone calls with the  
20 mine operator, as I recall, they did not want to  
21 submit this plan. They indicated that this was  
22 construction. However, because mineral and coal would  
23 be mined and subsequently methane and coal dust would  
24 be generated, we were uncomfortable ourselves without  
25 having a revision, so we did a verbal request for

1 this.

2 MR. FARLEY:

3 Seven North or --- what did you say?

4 A. I said Number Seven North belt, which is the  
5 annual belt that terminates its angle near the base of  
6 Headgate 22.

7 RE-EXAMINATION

8 BY MR. BECK:

9 Q. Joe, back on that December 18th reading again,  
10 when Chris Adkins and Bill Ross and I think it was a  
11 Lilly that showed up, did you have any idea they were  
12 coming or did they just pop in or ---?

13 A. No. They just popped in.

14 Q. Just popped in. When they said that what they  
15 attempted to do didn't work and that's why they're  
16 coming in with a request for another revision, did  
17 that mean that the air still wasn't functioning right  
18 at the mine?

19 A. That that neutral --- they indicated that that  
20 neutral air course would not reverse.

21 Q. But they kept on mining under those situations?

22 A. No, sir. To my knowledge, they shut down pursuant  
23 to 75.324, which would be power off of the affected  
24 area and the entire mine evacuated.

25 Q. They weren't mining at all then ---

1 A. Correct.

2 Q. --- in that ---?

3 A. Correct.

4 Q. Just on the longwall or anywhere in the mine?

5 A. I didn't ask that specifically, other than that  
6 plan, in and of itself, I believe has a  
7 requirement --- and of course, the Federal regulations  
8 are always there, but I think it states explicitly  
9 that it must be done in accordance with 75.324. Let  
10 me find it.

11 MR. STOLTZ:

12 It would be considered a major air  
13 change, though, to change direction?

14 A. It is a major air change. 75.324 is required  
15 regardless of whether it's stated in here or not. I  
16 stand corrected. It is not contained within here, but  
17 it is a requirement because of the air change.

18 MR. STOLTZ:

19 Is it a change in direction or greater  
20 than 9,000?

21 A. Correct.

22 BY MR. BECK:

23 Q. So to the best of your knowledge, they weren't  
24 mining then?

25 A. Correct. Yeah. If I had knowledge that they were

1 mining, the first thing I would have done is to inform  
2 them of the requirements of 75.324, which would  
3 prohibit that practice.

4 MR. STOLTZ:

5 Anything?

6 MR. BECK:

7 That's all.

8 RE-EXAMINATION

9 BY MR. STOLTZ:

10 Q. I guess the next plan would be the approved plan  
11 on January 20th, 2010, reverse intake airflow outby  
12 001 section or Headgate 22 section on the Number Two  
13 Crossover panel to break 12 on Headgate One.

14 BRIEF INTERRUPTION

15 A. There's two intake splits going to Headgate 22 at  
16 this time, one that goes up around this area called  
17 Eight North and comes back down and one that's coming  
18 up these --- along Number Four and Five entries of  
19 Headgate 22, along break 15 through 25. There's  
20 actually two intakes. And this plan was to reverse  
21 one of those intakes, which would take additional air  
22 to the longwall. And I asked exactly why this was  
23 needed because it's kind of odd to see an intake split  
24 go back towards outby, but however it joined back to  
25 the longwall. And that's indicative of that bleeder

1 fan's influence from Bandytown towards Headgate 22.  
2 And it appeared to me that that was a push/pull system  
3 and them trying to balance their air with regard to  
4 that.

5 Now, as far as me looking at it, I just looked at  
6 it, and yes, it does materially ventilate it. This  
7 area is not mined --- or has not ventilated a working  
8 section, and, therefore, it could be classified as  
9 intake air. But their intake air was coming here  
10 across two regulators, which is in this general area  
11 of break 135, just adjacent to the Glory North belt or  
12 the Glory Hole at the intersection of the mains and  
13 Headgate 22. And they indicated at that time that  
14 there was approximately 60,000 cfm at this overcast,  
15 near break 135 at the mouth of Headgate 22. And that  
16 15,000 would be coursing towards the longwall, which  
17 would supplement the longwall air ventilation. An  
18 estimated 45,000 was coming to the ventilating section  
19 of Headgate 22.

20 And on the section they were showing that they  
21 estimated 20,000 to Headgate 22. Of course, all the  
22 quantities are much higher than what would be required  
23 in the regulations or even in the methane dust control  
24 plan. So it functionally ventilated on paper. The  
25 exact reason is not specified in the plan submittal.

1 RE-EXAMINATION

2 BY MR. FARLEY:

3 Q. Joe, ---

4 A. Yes, sir.

5 Q. --- help me out here if I'm missing something on  
6 Federal law, but any time there would be a ventilation  
7 plan change, wouldn't there be a requirement that it  
8 be reviewed with the miners or posted on the bulletin  
9 board?

10 A. It has to always ---.

11 Q. What would the requirements be?

12 A. It always has to be posted on the mine bulletin  
13 board and supplied to the miners' rep. There isn't a  
14 miners' rep at this site, as indicated by their  
15 letter.

16 Q. Okay.

17 A. But within their letter they state, the change in  
18 air direction will be discussed with the persons  
19 affected and will be recorded in a pre-shift exam  
20 book. Additionally, our ---.

21 Q. I'm sorry. Go ahead.

22 A. Additionally, our ventilation approval stated in  
23 bold letters, all ventilation changes will be made in  
24 accordance with 30 C.F.R. 75.324. That's fairly  
25 common now. During this period of time there have

1       been numerous 75.370(d) violations and 75.324  
2       violations that have been issued. Within the back of  
3       my mind, September 1st, 2009 still existed, where they  
4       had a ventilation change in defiance of that  
5       regulation, and it begins to show up in plan  
6       correspondence to assure that the mine operator is  
7       placed on additional notice to comply with that reg,  
8       which would withdraw all persons, eliminate electrical  
9       power in the affected area, and the only people  
10      underground could be the people necessary to change  
11      the ventilation. And that's for protected measures.  
12      Additionally, 75.324 has an examination requirement  
13      where affected areas have to require --- have an  
14      examination to assure that nothing can be wrong or out  
15      of place for the safety of miners.

16      RE-EXAMINATION

17      BY MR. BECK:

18      Q. Joe, how did you get that plan? Did somebody  
19      bring that one to you also or ---?

20      A. No. We don't log in the method of delivery.  
21      This one says mail. But to be honest, we don't keep  
22      up with that so much. How we get it is a little less  
23      important than what's in it.

24      Q. And back on December 23rd, it was Chris Adkins who  
25      was Massey's Chief Operating Officer, and Bill Ross

1       came. Did Elizabeth Chamberlin or anybody higher than  
2       Chris Adkins come?

3       A. I don't recall that Elizabeth Chamberlin came for  
4       that.

5       Q. I mean, any --- come to talk to you any time about  
6       ventilation?

7       A. She comes intermittently for other issues. I know  
8       I've spoken to her with regard to other mines. I  
9       don't know if any discussions were had with her  
10      pursuant to this mine. It's not standing out in my  
11      memory.

12      Q. She's Massey's Vice-President of Safety; am I  
13      right?

14      A. I absolutely don't know their titles. I do know  
15      she's within their Safety Department and she is an  
16      attorney, but as far as what her exact title is, I  
17      don't keep up with it. Again, let me point out that  
18      having 245 coal mines within your district eliminates  
19      some of that intimate knowledge ---

20      Q. Oh, absolutely.

21      A. --- because you really are quite busy.

22      RE-EXAMINATION

23      BY MR. STOLTZ:

24      Q. Ready to move on? I'd like you to now go over the  
25      plan approved on January 22nd, 2010. That was the

1 plan to change intake air course on the Headgate One  
2 North panel to return air, show a ventilation scheme  
3 for the Number 22 Tailgate Panel or MMU 040, or  
4 sometimes it's even referred to as 02 section, show  
5 return air course on the North Glory Mains to intake,  
6 and change the intake air course in the Number Three  
7 entry on MMU 050, the longwall section.

8 A. It's indicated as received on our plan transmittal  
9 sheet on January 11th. It's dated by the mine  
10 operator January 8th. That frequently happens.

11 Contains a map --- two maps. Ventilation revision,  
12 phase one. Ventilation --- Panel 22 Tailgate, phase  
13 two. And it shows the startup of Tailgate 22 mining,  
14 as well as the projections that this was anticipated  
15 to be developed. This is the plan pursuant to the  
16 December 14th ARMPS' analysis, which I conducted or  
17 had roof control conduct for me of the area --- of the  
18 headgate and tailgate on Headgate One North and  
19 Tailgate One North, as well as a result of the  
20 degrading conditions which were issued by the  
21 inspector in the break 70 to 90 area.

22 Mike Haynes also traveled that area. I believe he  
23 saw the degradation. And it shows the three-entry  
24 system for Tailgate 22 reconnecting approximately at  
25 break 90 into the headgate. I had a concern with the

1 plan, which was addressed by the mine operator, that  
2 prior to starting --- it's hand written on this.  
3 Prior to starting the second longwall panel, Panel 22,  
4 additional safety precautions will be submitted to  
5 address mining into entries. And that was to assure  
6 that there was a controlled cut-through. But  
7 additionally, as the longwall is mining in this panel,  
8 it will encounter these entries. And when it  
9 encounters those entries, you will be required to  
10 remove shields and pan lines, reposition your tail  
11 drives, in an effort to shorten your longwall phase,  
12 it won't be as wide, and to mine it.

13 I felt like that was a roof control concern of  
14 mine at a future time. Any time you mine into  
15 entries, you now have a larger span that has to be  
16 supported. And I wanted to assure safety at a future  
17 date, and I wanted to do that via a site-specific  
18 revision, so that it was detailed and engineered. And  
19 that was as a safety enhancement. There was at no  
20 time described to the mine operator what they would  
21 have to submit. That was something we would just  
22 basically cross at that future time. The startup ---.  
23 Q. I guess a quick question on it then. This was  
24 proposed or submitted because of the degradation to  
25 the headgate entries. How much was --- how much of

1 that headgate entries was taking weight or hooving or  
2 whatever ---?

3 A. The extent of it?

4 Q. Yes.

5 A. That would be --- you would have to look on the  
6 previous citations issued. I mean, I believe it was  
7 at least ten crosscuts. But it appeared --- and  
8 according to Michael Haynes, our discussions with that  
9 was that it would continue to grow because all of the  
10 pillars were the same size. So if one pillar is too  
11 small, then they're essentially all too small, unless  
12 you get into a low cover area, at which time ---. I  
13 didn't do an overburden analysis. Again, I'm looking  
14 at ventilation. But certainly if it's at two  
15 crosscuts and inhibits travel, it doesn't maintain  
16 compliance with 75.384. Therefore, it can't be a  
17 tailgate travelway. So as far as the actual extent,  
18 it's kind of immaterial. If you can't travel one  
19 point, it's the same as not traveling all of them.

20 The revision is shown at two phases. Phase one  
21 shows the current ventilation and the controls being  
22 installed and removed to complete the ventilation  
23 change. Phase two map shows the ventilation after the  
24 changes had been completed.

25 The return off of 001 section, which is MMU 029,

1 will travel down the Number One entry of Panel One  
2 Crossover and mix with the return off of 002 section.  
3 That would mean immediately at the base of Tailgate  
4 22. A portion of the belt air from 001 section, not  
5 all the belt air from 002 section, will enter the  
6 return. This return will split at Headgate One North.  
7 Now, this says a portion of the belt air coming into  
8 the return at this location, which is the mine  
9 operator's choice on how he's going to handle his belt  
10 air with regard to the December 31st, 2008 regulatory  
11 change, the Final Rule.

12 This return will split at Headgate One North. The  
13 travel return for the sections will flow outby the  
14 Panel Two Crossover and across the Panel One Crossover  
15 to Tailgate One North. And that's this area  
16 (indicating) across the overcast at Crosscut 13 ---  
17 12, excuse me, and down along an isolated return, back  
18 to the return that was originally approved for the  
19 mining within the wedge area. And it's an isolated  
20 return.

21 Now, through discussions with virtually every mine  
22 operator in the district, when Robert Hardman became  
23 District Manager and I became Ventilation Supervisor,  
24 pursuant to the regulations it says under 75.364(b),  
25 that each return air course will be traveled in its

1       entirety. In the literal interpretation of that, we  
2       wanted each return air course traveled in its  
3       entirety. The reason for that is to assure that water  
4       doesn't complicate the return air courses to these  
5       mining sections. The top can't degrade or ribs can't  
6       --- or pillars can't degrade to the point that we lose  
7       an air course. Because losing the air course, if it  
8       happened in sufficient time, you wouldn't realize it  
9       until you lost air on the mining section. That could  
10      happen while mining was being conducted, and therefore  
11      would pose a hazard. That's why there's a necessity  
12      for an isolated return air course off of these  
13      sections. And we've maintained that requirement for  
14      all the district plans that have been approved through  
15      me and Bob --- recommended through me and approved by  
16      Bob Hardman. And that's their isolated return air  
17      course.

18     Now, they were also taking a portion of this  
19      return air through a regulator at crosscut 31 and it  
20      would remain isolated along the active intake  
21      escapeway to the section, and there would be a  
22      proposed evaluation point, EP-65, which would be the  
23      requirement for the weekly examination where air  
24      enters a worked-out area, pursuant to the Federal reg  
25      75.364(a)(2)(i). That's where air enters the

1 worked-out area. That was in addition to that  
2 required by the longwall face sketch.

3 But that was that isolated --- or it's isolated  
4 for the period while it's adjacent to the intake  
5 escapeway until it goes into the worked-out area. So  
6 the air would actually be evaluated as this additional  
7 EP was added, and the EPs that were previously ---  
8 originally approved on August 6th remained. It did  
9 not drop those EPS. And although they're not labeled  
10 on the map, they are not dropped, because we limit the  
11 operator's request to exclusively what's in writing.

12 The regulator --- also in the plan, the regulator  
13 currently allowing neutral air from the longwall belt  
14 to enter the return at 11 Break will be relocated to  
15 12 Break. They moved that regulator from --- one  
16 crosscut, back into a return. This relocation will  
17 allow intake to course over the overcast at 11 Break.  
18 The return entries along North Glory Mains will be  
19 converted into intake entries, which is this area  
20 along this wedge, adjacent to crosscut 115, along with  
21 Number Seven North belt, which is additional intake  
22 entries were added to supplement the loss of the  
23 intake entries along crosscuts 15 through 25 in the  
24 headgate. They rerouted their intake.

25 It appeared to satisfy the requirements of 75.380

1 for escapeways. With regard to being the most direct,  
2 it's as direct. It is practical, and therefore was  
3 approved.

4 Q. How do they normally regulate their sections?

5 A. Within their section typicals, there is a  
6 regulator shown on their typical face sketch, which is  
7 to be placed outby the section, in its section return.  
8 Each section return should be regulated independently  
9 from one another. Also, the Headgate 22 section is  
10 shown an estimated 20,000 cfm of ventilating air  
11 current, which is more than double the requirement.  
12 002 showed an estimated 20,000 cfm of intake air,  
13 which is, again, more than double the 75.325  
14 requirement. And the volume shown on the longwall,  
15 the operator is saying they estimate they had 90,000  
16 at that time, which is three times the minimum  
17 required by Federal regs. So therefore, the  
18 ventilating air current is shown properly sufficient  
19 to assure ventilation.

20 Q. That split where you had return air either heading  
21 toward the --- inby, coming up the headgate  
22 return, ---

23 A. Uh-huh (yes).

24 Q. --- or the return that's going to go out around  
25 through the crossover, would that be controlled by

1 regulation then?

2 A. Yes, sir. It should be controlled by the  
3 regulator. There's actually a regulator here shown on  
4 that return at --- the first crosscut in the headgate  
5 --- or excuse me, Tailgate 22, there's a regulator  
6 shown there.

7 Q. Will that be controlling the section?

8 A. That would control a section return. This return  
9 air split, which goes from break 25 along the headgate  
10 back towards break 15, across the Panel One Crossover  
11 around the bottom end appears to me to be unregulated  
12 free split due to its great distance. You know, it  
13 travels a lot farther than the rest of them.

14 Additionally, the longwall air is regulated of its  
15 own accord by EP Headgate One and EP Tailgate One just  
16 here on the outlet of the longwall itself. So each  
17 split appears to be regulated except for the  
18 unregulated free split, which would be the Number One  
19 entry that goes out to the Number Two entry along the  
20 Tailgate 22 --- 21, excuse me. On this map it's also  
21 shown as Tailgate One North.

22 Q. The addition of those tailgate entries, the new  
23 tailgate section, is that typical?

24 A. It is not typical at all.

25 Q. Something very unusual, isn't it?

1 A. Very unusual.

2 Q. Was there some sort of analysis performed? ARMPS  
3 helps. I see there's a small barrier between the  
4 sections, I mean, to allow so that the --- those new  
5 entries would not take the same weight that the  
6 headgate entries are seeing now?

7 A. I did not perform that analysis. However, their  
8 roof control plan should contain, and I'm sure it does  
9 contain, although I don't --- I can't tell you where,  
10 a requirement for stability of those entries. I did  
11 --- I asked Mr. Eric Lilly if they had done that, and  
12 he said yes.

13 RE-EXAMINATION

14 BY MR. BECK:

15 Q. Joe, back on --- I'm just jumping back a little  
16 bit. On December 23rd you got a letter from Chris  
17 Blanchard stating that within 30 days of approval, the  
18 plan back in that time frame --- well, they couldn't  
19 comply with the December 18th plan?

20 A. Correct.

21 Q. Within 30 days of approval, did they submit a  
22 long-term ventilation plan that would show long-term  
23 solutions to allow belt air to travel outby as well as  
24 to open more intake air courses?

25 A. Correct.

1 Q. Did they ever submit that plan within 30 days?

2 A. No, sir.

3 Q. Did they ever explain why they didn't?

4 A. No, sir.

5 Q. Okay.

6 A. It appeared to me that subsequent to this January  
7 22nd plan, the emphasis at that time was the mining of  
8 the tailgate as soon as possible to limit the amount  
9 of time that the head --- that the longwall was  
10 parked. See, when this longwall finished, it had  
11 nowhere to go. Subsequently, there is an LBB Number  
12 Five Panel, which is very near the Ellis Portal. It  
13 is a panel where essentially the panel width and the  
14 panel length are about the same. It's extremely  
15 small. That is also very odd. That's the smallest  
16 longwall panel I've ever seen. And I believe that  
17 that --- those projections in that ventilation  
18 revision was submitted purely to prevent this longwall  
19 from slipping. And that's directly in relation to the  
20 failed headgate pillars and the conditions within the  
21 headgate, that they couldn't use the current headgate  
22 as the following tailgate.

23 Q. You said that one there would be what, a month's  
24 money, at best probably?

25 A. Sir, I don't know if I could answer that. Under

1 ideal conditions, possibly.

2 Q. I mean, just based on ---.

3 A. It really depends on their advancement.

4 Q. Just based on what you see what they did on other  
5 longwall panels in the mine.

6 A. Yeah. I mean, the month of October, according to  
7 this map, they did fairly well. The month of  
8 December, not so well. So it depends on conditions.  
9 Could be as few as.

10 MR. STOLTZ:

11 Okay. We'll move on.

12 SHORT BREAK TAKEN

13 ATTORNEY WILSON:

14 Back on the record.

15 RE-EXAMINATION

16 BY MR. STOLTZ:

17 Q. Okay, Joe. I guess I'd like to go over now the  
18 approved plan dated February 22nd, 2010. It was  
19 approved due to water accumulation. It relocated EP  
20 LW3 from break 85 to 90.

21 A. Basically is to relocate EP LW3 from a water hole  
22 to the shoreline. I actually got to speak to Eric  
23 Lilly about this, and he said literally they just  
24 didn't want to stand in the water to take an air  
25 reading. The mine map itself shows a water

1 accumulation at break 85, 86, 87, 88 and 89. However,  
2 it doesn't appear to be substantial to interrupt  
3 ventilation. And the ventilation scheme itself didn't  
4 change in that it actually only moved one three  
5 crosscuts and two other evaluation points four  
6 crosscuts. My primary concern with this was, are they  
7 taking air readings at all the entries to assure that  
8 they can compensate --- or meet the requirements of  
9 75.364 with regard to quantity, quality and direction,  
10 therefore, you know, getting all three splits  
11 satisfies the quantity requirements. So I didn't have  
12 any issue with that, and I approved it.

13 It certainly doesn't state that the water is an  
14 issue or that it is impacting ventilation in any  
15 degree. And it was actually routed through Thomas  
16 Moore, the Field Office Supervisor at the time, and  
17 Link Selfe, who is also --- and Rich Kline. I mean,  
18 everyone seen all the plans for the mine up to this  
19 point, so it didn't seem to be an issue.

20 MR. STOLTZ:

21 Terry? Jim?

22 MR. BECK:

23 No.

24 BY MR. STOLTZ:

25 Q. Moving on, I guess the next plan would be the

1 approved March 11th, 2010 plan. It corrects the  
2 violation condition on the longwall tailgate and  
3 depicts the new tailgate isolated split.

4 A. This plan is a direct result of in-mine inspection  
5 which occurred immediately prior to that and which  
6 there was an order issued on the Tailgate one North  
7 area. And that order was issued by Keith Sigmon, who  
8 has traveled with Tom Moore. Keith Sigmon was in the  
9 mine with some additional specialists that work for  
10 me, and they went to the sections. And essentially  
11 I've been --- I routinely talk, especially about this  
12 mine and the vast number of revisions, I routinely had  
13 talked to Joey Athey several quarters before, which  
14 led to my September 1st visit. I talked to Kevin  
15 Lyall, which led to the visit to the headgate entries  
16 by Mike Haynes and, I believe, Keith Sigmon. And I  
17 was talking to the current inspector, which was Keith  
18 Stone. And he felt like he needed to get a feel for  
19 all the different areas all at one time. Now, one  
20 inspector can't do that, and we call it robbing Peter  
21 to pay Paul to see what the volumes are in several  
22 areas.

23 So I actually was supposed to go to that mine. I  
24 believe they went on either March 8th or 9th. And I  
25 was supposed to go there, but due to other issues,

1       like I had to take an online training course. I was  
2       going to be at another meeting the following day and I  
3       didn't want to be out and allow all these plans to  
4       build up. I can't leave the district unattended, so  
5       at the last minute I actually pulled out from going to  
6       the mine this day, which is not normal for me.

7       But at any rate, Keith Sigmon and Tom Moore  
8       crossed the longwall face and went into the Tailgate  
9       One North entries, at which time they found that the  
10      air has actually reversed and flowing outby or towards  
11      the mains instead of towards the bleeder for nearly  
12      its entire length, stagnated for a portion, and then  
13      turned around and near the Number Three entry was  
14      actually going towards the bleeder air course. It  
15      essentially had a large swirl.

16     What concerned me, as soon as Keith found it, he  
17     called me on the phone from the mine. And my primary  
18     concern was that they would pull gob air or air from  
19     the worked-out area that was caved behind the longwall  
20     panel across the tailgate drives, which would be a  
21     potential ignition source. Albeit they're  
22     permissible, you certainly don't want to see that risk  
23     taken, specifically ventilating that corner of the  
24     face when the longwall shearer cut out. Now, that's a  
25     significant ignition source. So any time you have

1 longwall air that's not going towards a bleeder and is  
2 actually reversed, regardless of the issue, there's a  
3 hazard there, and regardless of the methane content of  
4 the mine. And you're also concerned always with coal  
5 dust.

6 He issued that as an order. And subsequent to  
7 that, they had to do something to correct it. And I  
8 was told, via telephone call by one of the mine  
9 operator's agent, I believe it's the engineer, Matt  
10 Walker, who had submitted it --- it was either Matt  
11 Walker or Eric Lilly, that they tried to adjust this  
12 regulator that's here at crosscut 34 in order to  
13 increase the volume of air up this tailgate in order  
14 to compensate for that. But they were not successful,  
15 so they elected --- and I had asked for this several  
16 times previously. I guess I asked them, why don't you  
17 have a tailgate stopping line, which is typical. And  
18 you'll even see that within the typical bleeder plans  
19 and guidelines within the agency, the bag class that  
20 they give to ventilation specialists, that that is  
21 generally a necessary control. Now, Massey doesn't  
22 like to do that because there is some construction  
23 requirement with that and labor costs that would be  
24 associated with that. But they actually were going  
25 to --- submitted this to reconstruct that tailgate

1       stopping line. And they gave actual measurements on  
2       the regulators there that indicated they were putting  
3       73,386 cfm up their tailgate.

4       Now, because they have five tailgate entries in  
5       this area, they're prone to losing the velocity. So  
6       you have to put a larger volume up there, which would  
7       spread across the larger area, and therefore decrease  
8       its velocity, and that would govern it. They actually  
9       took actual air readings at the tailgate and entries  
10      Three, Four, Five and Six and Seven, right there at  
11      the tailgate junction of the longwall face, and  
12      they're actually showing that they have 61,000 going  
13      across the longwall face, which would be  
14      significantly ---. At the outlet of the longwall face  
15      they have more than double what's required in the  
16      inlet.

17     So this plan doesn't show any intake problems, per  
18     se. It actually shows something contrary to that. It  
19     shows that even though they're losing air through the  
20     gob along the longwall face, near their tail, they  
21     still have 61,000. So that's a considerable amount of  
22     air. It's actually promising. And this was to abate  
23     that violative condition and then subsequently the  
24     order associated with it.

25     Q. I guess just a quick question. I guess up until a

1 point, they were able to pull the air back to the  
2 Bandytown fan?

3 A. Correct.

4 Q. So in your opinion, what happened to the system to  
5 cause the air now to reverse and, you know, then the  
6 resubmittal --- or the resubmittal of this plan? I  
7 shouldn't say resubmittal, submittal of this plan?

8 A. Submittal of this plan. I think that the small  
9 pillars in the tailgate, which were mined at  
10 approximately the same center as the headgate and also  
11 didn't satisfy the stability minimum recommended by  
12 ARMPS could have been a potential factor.

13 Additionally, convergence along the side abutment  
14 zone along this panel could also make air difficult.  
15 And as they mined this panel out and it's gotten  
16 longer, you're looking at more resistance with regard  
17 to that return air course from the longwall face back  
18 towards the EP, where air exits a worked-out area.

19 And additionally, they may have lost volume here  
20 when they put the tailgate section on. And  
21 subsequently, the system itself changed. So other  
22 changes in the mine could also affect the volume air  
23 going up that tailgate.

24 I know at one time Mike Haynes went to the mine  
25 and came back. We did a line diagram. Now, this was

1 back approximately December, November, in that area.  
2 I actually had specialists there September, November,  
3 December, February and March. Five out of seven  
4 months I sent ventilation specialists to this mine.  
5 And my purpose for that was, I was talking regularly  
6 to the inspection personnel and we wanted to keep  
7 close tabs on it, particularly because they had a high  
8 volume of revisions.

9 So, you know, I didn't go to this exact area. One  
10 of my specialists did, as well as a field office  
11 supervisor. And I can only surmise that as the air  
12 course has increased, that it would be a little more  
13 difficult to ventilate. And the tailgate mining may  
14 have had an impact on it as well.

15 Q. I guess that's all I'm getting at. Since you're  
16 sending so many specialists out and you named them in  
17 the various months, that would be abnormal?

18 A. It's very abnormal. In fact, we visited this mine  
19 more than any other in the district. And we issued  
20 orders here. I issued orders when I visited there.  
21 There were --- my guys issued orders on the headgate.  
22 My guys issued orders on the tailgate. That's  
23 extremely abnormal.

24 Q. I guess my next follow-up question, the order was  
25 issued and they submitted a plan. Why do you think it

1 took greater than two days to fix the problem?

2 A. I believe on the 10th --- on the 10th, Keith Stone  
3 went to terminate the order. He's the regular CMI for  
4 the quarterly inspection. He called me from the mine  
5 and stated that they had built new controls, looked  
6 like everything was going fine, and the mine operator  
7 wanted him to lift the order. And I said, are all the  
8 controls installed, and is the air functioning as  
9 designed in this plan? His answer to both was no. I  
10 told him, therefore, the order still stands, period.  
11 According to the Mine Act, it must be totally abated,  
12 and that's what we were looking for.

13 They called the afternoon of December 11th --- or  
14 excuse me, March 11, requesting --- or stating that  
15 the mine was in compliance and requesting the order to  
16 be lifted. And that's frequently the case when an  
17 order is issued to a mine operator. They want it  
18 abated as soon as they've got it corrected. It can be  
19 after hours, and they will exert significant pressure  
20 to assure that it gets --- they get their abatement.

21 Keith Stone had already worked that day. He  
22 really didn't want to go back out. All of my guys  
23 were gone already. Keith Stone --- or excuse me,  
24 Keith Sigmon wasn't in. Keith Stone went in lieu of  
25 Keith Sigmon and essentially I cut a deal with him.

1 And that deal was, if you can go terminate Keith  
2 Sigmon's paper, my guys would run dust for you on the  
3 working sections, on the headgate and tailgate  
4 development sections. That's to tell him, you know,  
5 basically you help me, I help you.

6 But what Keith Stone didn't realize at the time,  
7 it was kind of a chess move on my part, it was a nice  
8 way of getting him to go out after hours for me, of  
9 course, but --- or for my guys, but I really hadn't  
10 got comfortable with their numerous changes yet. And  
11 what I really wanted --- because we'd already done  
12 these district-wide mine inspections for months. I  
13 wanted my guys on the working section for the entire  
14 shift. That's hard to do with a ventilation  
15 specialist because you're not a regular CMI. You have  
16 other duties.

17 So I was able to do that. And so what you see is  
18 Clyde Gray and Benny Clark ran dust, which is  
19 extremely out of the ordinary for a ventilation  
20 specialist to run dust pumps for an entire shift. And  
21 to be honest, they weren't that crazy about it, but it  
22 was necessary for me to understand and to have an on-  
23 site specialist for the entire shift to assure that  
24 the air is functioning properly at the face, where  
25 miners are exposed, where the risk for anything is the

1 highest, to assure that it was safe. And that's  
2 exactly why I did it. And you'll see that later in  
3 the inspection reports, that those ventilation  
4 specialists actually did that.

5 MR. STOLTZ:

6 Terry?

7 MR. FARLEY:

8 I don't have any more.

9 MR. STOLTZ:

10 Jim?

11 MR. BECK:

12 I'll wait until after the next one.

13 MR. STOLTZ:

14 Okay.

15 BY MR. STOLTZ:

16 Q. Ready to move on with the last approved plan here.

17 A. And to my knowledge, in a follow-up conversation  
18 with Keith Stone, this plan was successful. It abated  
19 the violative condition. There was no methane found  
20 and the air functioned as designed.

21 Q. I guess the last approved plan would be the March  
22 22nd, 2010 plan. It's a revision to replace the  
23 typical longwall face sketch depicting ventilation  
24 controls along the remainder of the One North  
25 headgate.

1 A. Now, I requested this because when they crossed  
2 the Panel Two Crossover, I was concerned that this EP  
3 that was previously approved that was to be  
4 located --- I think the number was 65 in this Number  
5 Three air course of the headgate would no longer  
6 progress outby, that it would stop with this regulator  
7 that's located immediately off of Tailgate 22. And I  
8 wanted to assure, in compliance with the regulation  
9 75.364(a)(2)(i), that everywhere where air entered the  
10 worked-out area, that that was an evaluation point  
11 that was approved by the district manager and that  
12 that evaluation point could not move. And that was to  
13 assure that the plan itself did not become outdated.

14 And again, the reason to get quantity, quality and  
15 direction at evaluation points is so that you can  
16 understand the system, you can measure the system and  
17 you can make those changes as necessary, because the  
18 mine operator ---. It's the mine operator's  
19 responsibility for pre-shift, on-shift and weekly  
20 examinations to assure that they can abate any kind of  
21 hazardous conditions.

22 Q. So that would be basically a part of the weekly  
23 examination?

24 A. It would be part of the weekly examination, yes,  
25 sir. And it includes a submittal letter from the ---

1 Eric Lilly, the mine engineer, dated on the 10th,  
2 received on the 10th. And because the mine was  
3 progressing, the longwall was progressing outby and  
4 they were going to pass this area, I wanted to make  
5 sure that we expedited the review of this. Let's not  
6 get a plan after it's no longer necessary. Let's get  
7 the plans prior to being necessary so that, you know,  
8 things function correctly underground. And it shows  
9 MPA, MPB, the EPs on the longwall. And it also  
10 requires this stopping line will be kept intact to  
11 ensure separation of the gob air and the travelable  
12 return.

13 And what it was is that's the return air off the  
14 section being separate from the intake to the  
15 longwall, because there's a potential contamination  
16 issue if they lose that stopping line. So during a  
17 verbal request, I want to make sure that this stopping  
18 line is important. You have to keep it. And so they  
19 put that in the plan.

20 Q. So if I understand, that EP would --- was that  
21 in --- return air coming into the worked-out area?

22 A. Is return air coming into the worked-out area?

23 Q. It would be splitting? Some would be going  
24 inby ---?

25 A. No, sir.

1 Q. Not all traveled inby?

2 A. It split at the same split point as the January  
3 22nd revision, which is the Number One entry, which is  
4 a return entry on Tailgate 22, immediately adjacent to  
5 the regulator, that that return air would go ---  
6 travel to the east, along Headgate 25 through 15  
7 crosscut numbers. And then EP --- it doesn't have a  
8 number on it, but that EP would stay stationary. So  
9 that is a portion of the ventilating return air off  
10 the section going into the worked-out area, into the  
11 headgate. The other isolated return air course that  
12 was in the January 22nd revisions remained intact.

13 Q. Okay.

14 A. But the ventilating arrows are shown on the  
15 typical longwall face sketch. They call it typical,  
16 but it's really no longer typical. It's site-  
17 specific. But it would remain in effect until the  
18 completion of the longwall, at the longwall stop  
19 point, which is shown on this map, on Mackowiak One,  
20 as crosscut 14.

21 Q. And that was the only thing that changed --- that  
22 was changed on that face? Everything else, all the  
23 MPs and EPs stayed the same?

24 A. Yes.

25 MR. STOLTZ:

1 Jim?

2 RE-EXAMINATION

3 BY MR. BECK:

4 Q. Joe, from August 6th, I think it was, to March  
5 22nd, I count 14 revisions that were approved. Is  
6 that right?

7 A. I never counted them. If you give me a minute, I  
8 can.

9 MR. STOLTZ:

10 There's probably even more.

11 ATTORNEY WILSON:

12 Well, Joe, the record will show how many  
13 there were.

14 MR. BECK:

15 I counted them.

16 A. Yeah, I can't --- it sounds about right.

17 BY MR. BECK:

18 Q. And you said five out of seven months you had  
19 specialists at the mine, and you, yourself, made a  
20 couple trips down there. So is it safe to say the red  
21 flag's up, we've got some major ventilation issues  
22 here at Upper Big Branch?

23 A. We were trying to prevent major ventilation issues  
24 due to the lack of trust ---.

25 Q. Well, what I was getting at, I mean, did anybody

1 ever go to Massey and say, look, you know, you're  
2 grasping for straws here, I mean, you're throwing all  
3 these plans out every couple days and you're even  
4 coming back with plans that --- revisions for plans  
5 that didn't work that you tried? It just seems like  
6 they were grasping for straws.

7 A. There was a lack of proper planning as far as the  
8 long-term perspective. Additionally, their engineers,  
9 Eric Lilly, Matt Walker and Heath Lilly, are very  
10 inexperienced. They're quite aggressive with regard  
11 to mining coal, and I think that the combination of  
12 those factors led to numerous revisions.

13 Q. Do you know if they ever made an air change  
14 without approval or prior to getting approval, major  
15 air change?

16 A. I believe they did, but I think you would be well  
17 served to pull the 370(d) violations. That would be  
18 the section of the regulation that would govern that.  
19 I can't give you that answer off the top of my head,  
20 but that data is available.

21 Q. Do you know if around 14 --- set 14 seals and 15,  
22 if there were ever any air samples taken in those  
23 areas?

24 A. I can tell you during each EO1 they should pump  
25 samples from within the sealed --- from within the

1 sealed atmosphere.

2 Q. If they did, then that data would be available?

3 A. It would be in the inspection reports, yes, sir.

4 I don't receive inspection reports on a daily basis.

5 Q. All right.

6 A. But they should pull those. The mine operator

7 also, I believe, has data concerning that.

8 Q. Okay.

9 ATTORNEY WILSON:

10 Let's go off the record.

11 OFF RECORD DISCUSSION

12 ATTORNEY WILSON:

13 All right. We had a discussion off the

14 record. What we're going to do is stop Mr.

15 Mackowiak's interview now, and it's 4:10 on Monday

16 afternoon, and we will resume tomorrow afternoon at

17 one o'clock. We're off the record.

18

CERTIFICATE

I, Alison Salyards, a Notary Public in and for the State of West Virginia, do hereby certify:

That the witness whose testimony appears in the foregoing deposition, was duly sworn by me on said date and that the transcribed deposition of said witness is a true record of the testimony given by said witness;

That the proceeding is herein recorded fully and accurately;

That I am neither attorney nor counsel for, nor related to any of the parties to the action in which these depositions were taken, and further that I am not a relative of any attorney or counsel employed by the parties hereto, or financially interested in this action.

*Alison Salyards*
