

PUBLIC SUBMISSION

As of: 11/13/17 2:50 PM Received: November 06, 2017 Status: Posted Posted: November 13, 2017 Tracking No. 1k1-8znc-imks Comments Due: January 09, 2018 Submission Type: Web
--

Docket: MSHA-2014-0031
Exposure of Underground Miners to Diesel Exhaust

Comment On: MSHA-2014-0031-0076
Exposure of Underground Miners to Diesel Exhaust: Request for Information; Reopening of Rulemaking Record; Extension of Comment Period

Document: MSHA-2014-0031-0103
Comment from n n, NA

Submitter Information

Name: n n
Organization: NA

General Comment

The Oceans are actually Cooling , Another bombshell to hit the global warming alarmists and their speculative climate modeling came in Geophysical Research Letters which found that over 20% of the heat gained in the oceans since the mid-1950s was lost in just two years. NASA satellite tropospheric temperature data reveals that the Southern Hemisphere has NOT WARMED in the past 25 years contrary to "global warming theory" and modeling. This new Southern Hemisphere data raises the specter that the use of the word "global" in "global warming" may not be accurate. A more apt moniker for the past 25 years may be "Northern Hemisphere" warming. National Oceanic and Atmospheric Administration (NOAA), the January through June Alaska statewide average temperature was "0.55F (0.30C) COOLER than the 1971-2000 average. Climatologist noted that the sudden cooling of the oceans "certainly indicates that the multi-decadal global climate models have serious issues with their ability to accurately simulate the response of the climate system to human- and natural-climate forcings. There have been recent findings in peer-reviewed literature over the last few years showing that the Antarctic is getting colder and the ice is growing and a new study in Geophysical Research Letters found that the sun was responsible for 50% of 20th century warming. Academy of Sciences, predicted long term global cooling may be on the horizon due to a projected decrease in the sun's output. 60 prominent scientists who question the basis for climate alarmism, clearly explains the current state of scientific knowledge. One of the ways alarmists have pounded this mantra of "consensus" on global warming into our pop culture is through the use of computer models which project future calamity. But the science is simply not there to place so much faith

in scary computer model scenarios which extrapolate the current and projected buildup of greenhouse gases in the atmosphere and conclude that the planet faces certain doom. Research Center said that highly publicized climate models showing a disappearing Arctic were nothing more than "science fiction." The history of the modern environmental movement is chock full of predictions of doom that never came true. We have all heard the dire predictions about the threat of overpopulation, resource scarcity, mass starvation, and the projected death of our oceans. None of these predictions came true, yet it never stopped the doomsayers from continuing to predict a dire environmental future. on the constant doom saying of the global warming alarmists and their media allies. winter in many parts of the U.S. have further put a damper on the constant doom saying of the global warming alarmists and their media allies. the claim that droughts would be more frequent, severe and wide ranging during global warming, has now being exposed as fallacious. A new paper in Geophysical Research Letters authored by Konstantinos Andreadis and Dennis Lettenmaier finds droughts in the U.S. becoming "shorter, less frequent and cover a small portion of the country over the last century scientist and colleagues showed that the interior of Greenland is gaining ice mass. Also, according to Research Institute, despite all of the media hype, the Arctic was warmer in the 1930's than today. Media's unfounded hype, polar bears are not facing a crisis, according to biologist Dr. Mitchell Taylor from the Arctic government of Nunavut. "Of the 13 populations zones of polar bears in Canada, 11 are stable or increasing in number. They are not going extinct, or even appear to be affected at present. New data debunking climate alarmism mounts, the mainstream media chooses to ignore it and instead focus on the dire predictions of the sky-is falling climate scare reports. the use of "extreme scenarios is a tactic to drive the public's attention to the false information. global warming alarmists may have significantly overplayed their hand in the climate debate. A poll found that most Americans do not attribute the cause of any recent severe weather events to global warming, and the portion of Americans who believe that climate change is due to natural variability has increased over 50% in the last five years.
