I am ____________, Superintendent of the No. 1 Mine. You are located at the fresh air base on the West Mains section. A maintenance crew of three persons entered the section this morning to check the water level in the section and work on the section pump. A loud noise and a rush of air from the section were later noticed by the shift foreman, who was in the mine at the time. He called the control center and ordered a mine evacuation. A mine-wide evacuation order was transmitted over the mine’s PED system. The check-in/check-out board indicates that 28 of the 31 miners in the mine at the time of the incident have arrived at the surface.

The West Mains section contains two air shafts; an intake shaft with a blowing fan on the surface and a return shaft. The blowing fan is off, but can be started if needed. Both shafts are being monitored on the surface. The locations of the shafts are shown on the mine map that will be provided. An exhausting main fan on the surface is also used to ventilate the mine. This fan must remain on and cannot be reversed. The fan is being guarded and sampled.

Mine rescue teams explored as far into West Mains that they could and established the fresh air base where we are located. At present, there is no air movement into or out of the West Mains section inby the fresh air base. Air movement at the fresh air base is indicated on the mine map that will be provided. The mine map is a solid-line, up-to-date map.

The mine is walking height and supported by resin-grouted roof bolts. All electrical circuits to the West Mains section have been disconnected, locked-out and guarded. The mine has experienced adverse roof conditions and problems with water. The mine liberates 11,670,000 cfm of methane per day.

A backup team is on site and another team is on standby. All state, federal, and local officials have been notified and are on site. You will have 90 minutes to work the problem. Mine maps and instructions will be provided.
