Washington, DC 20002

RE: Generation of Silica Round Robin Samples  
RJ Lee Group Project No.: TLH202429

Dear Mr. Morrill:

In accordance with American Chemistry Council Contact #5288, RJ Lee Group has generated a series of round robin samples to test the precision and accuracy of x-ray diffraction (XRD) analysis of airborne silica samples. The generated filters were shipped on Friday, April 27, 2012 by UPS (tracking no. 1Z2644030395059479) to Dr. Anish Ranpuria at Sandler Occupational Medicine.

#### *Source Mineral Samples*

Three powdered mineral samples were selected for use in this project: Min-U-Sil 5, kaolin, and soda-feldspar from NIST (SRM 99a). To ensure that the minerals were of a respirable size, the oversize material in each sample was removed using sedimentation. A portion of the mineral was suspended in pH neutral, distilled water, agitated, and poured into a volumetric cylinder (similar to an Andreasen pipette). The suspension was allowed to settle over a distance of 10 cm for 75 minutes before the remaining supernatant was siphoned and filtered. Each material was dried in a low-temperature oven overnight before use in preparing the test filters.

#### *Filter Preparation*

Polyvinyl chloride (PVC) filters with a pore size of 0.8 µm were used in this project. Each filter was assigned a random number for tracking purposes. Each filter was dried in a low temperature oven (30 °C) for 3 days before being placed in a desiccator for a minimum of 2 days. At the end of this time, the filters were weighed.

The test materials were: 1) pure silica (Min-U-Sil); 2) kaolin; and 3) soda-feldspar. Each material was dried and desiccated prior to filter preparation. The materials to be deposited onto the filters are pure silica, and 50:50 (by weight) mixtures of silica and either kaolin or soda-feldspar.

To prepare the filters, a portion of the test material was weighed on a Mettler X5 analytical balance to the target weight. For this program, the target weights were 0.020 mg (25 µg/m<sup>3</sup>, 800 L sample), 0.040 mg (50 µg/m<sup>3</sup>, 800 L sample), and 0.080 mg (100 µg/m<sup>3</sup>, 800 L sample). The weighed portion was suspended in 25 mL of 2-propanol, sonicated and filtered onto the PVC filer that had been placed into a vacuum filtration holder. The filtered sample was placed into a desiccator for 2 days before weighing.

The weights and dates for this project are shown in Table 1. A spreadsheet of this Table is available.

The balance used in this project (Mettler MX5) is calibrated daily using 100 mg and 20 mg Class 1 weights. Since the start of 2012, the average reading for each calibration standard has been: (200 mg) 199.995 and (20 mg) 20.001. The standard errors for these readings are: (200 mg) 0.00023 and (20 mg) 0.00012. This suggests that, for inert materials, the observed weights are both precise ( $\pm 0.0005$  mg) and accurate.

*Sample Packaging*

Each filter was packaged into new, 2-piece 37-mm cassettes. A generic label was affixed to the outside of the cassette to facilitate sample tracking. The label contains no corporate markings.

The prepared cassettes were placed into zip-lock plastic bags, grouping similar matrices and loadings. For example, all of the 25  $\mu\text{g}/\text{m}^3$  silica-only samples were placed in one bag, all of the 50  $\mu\text{g}/\text{m}^3$  silica-only samples placed in another bag, etc.

The samples were boxed and shipped via UPS to Sandler Occupational Medicine.

If you have any questions, please feel free to contact me.

Sincerely,

Drew R. Van Orden, PE  
Senior Consulting Scientist
